

# Topological Fixed-Point Theory (TFPT)

A discrete compiler for the constants of physics

Two inputs — the boundary constant  $c_3 = \frac{1}{8\pi}$  and a five-slot carrier — build  $E_8$  and read off the Standard Model: status assessment and reading guide

Stefan Hamann

August 27, 2026 · v5.4 (rev 827)

## In one sentence

**Topological Fixed-Point Theory (TFPT)** constructs, from exactly **two inputs** — a boundary constant  $c_3 = \frac{1}{8\pi}$  (P1) and a five-slot carrier  $g_{\text{car}} = 5$  (P2) — a discrete compiler for the Standard-Model skeleton: the gauge group, three families, hypercharges and the flavor matrix, with  $E_8$  ( $D_5 \oplus A_3 + \mu_4 \Rightarrow E_8$ ) as the consistency checksum. The *algebraic core is machine-checkable* and the dimensionless constants follow as fixed points ( $\alpha^{-1} = 137.0359992$ ); *physical readouts* — absolute scales, masses, inflation, gravity and cosmological transfers — run through explicitly *named, status-typed bridges* ( $v_{\text{geo}}$ ,  $G_{\text{net}}$ ,  $F_{\text{transfer}}$ ), not as free outputs. The honest one-line claim is on the status card below.

## The TFPT document set — what is treated where

**Plain language:** TFPT (Topological Fixed-Point Theory) is a small discrete compiler. Two inputs — the seam constant  $c_3 = \frac{1}{8\pi}$  and the carrier rank  $g_{\text{car}} = 5$  — build  $D_5 \oplus A_3 + \mu_4 \Rightarrow E_8$  and read off the Standard-Model skeleton, the constants and the scale grammar. The series is **the introduction plus five numbered papers and five companions** (plus two standalone working notes), best read in order:

0. **introduction** — reading guide, compiler closure, predictions, the dependency DAG and the single proof ledger (`verification/status_ledger.csv`). (*entry point*)
1. **tfpt\_1\_architecture\_e8** — the two axioms, the derivation map, the EM fixed point  $\alpha^{-1}$ , the  $D_5 \oplus A_3 + \mu_4 \Rightarrow E_8$  construction, the QBL theorem chain.
2. **tfpt\_2\_standard\_model** — the SM in one  $\varphi_0$ -ladder formula, flavor from parabolic transport (sheet diamond, dual anchor,  $Q_+$  cohomology), the worked closures.
3. **tfpt\_3\_e8\_audit\_bootstrap** — the seven  $E_8$  slices as an audit raster, the cascade bridge, the Möbius bootstrap.
4. **tfpt\_4\_frontier** — honest status of  $\eta_B$ ,  $m_p/m_e$ , Koide, dark matter, full QG.
5. **tfpt\_5\_redteam** — the adversarial audit: declared attacks, what survives, what each reduces to, and the kill tests.

**Companions:** **R. tfpt\_research\_contracts** — the open interfaces ( $v_{\text{geo}}$ ,  $G_{\text{net}}$ ,  $F_{\text{transfer}}$ ) as numbered contracts; **H. tfpt\_horizon\_readouts** — Appendix H (unit-system reframe): one seam constant as the universal horizon thermal code, the Nariai/anchor surface, the resummed seam clock; **O. origin\_theory** — why no free fundamental number remains (exact core + one honestly-typed cyclic interpretation); **S. tfpt\_safeguards** — the verification discipline: every mechanism that defends a claim against coincidence and numerology (status calculus, no-free-pattern, the over-determination map, the fire-wall, frozen predictions + null model, the independent Wolfram and Lean paths, the red team); **P. tfpt\_prime\_front** — research documentation of the prime / zeta line: the seven load-bearing modules on the  $E_8$  glue census (Hecke from geometry through the transport ledger), the sandbox localization program that follows them, and the kill list. Documentation, not a result: it makes no claim about the Riemann Hypothesis.

**Working notes:** **N1. note\_e8\_gaussian\_code** — the Gaussian code bridge:  $E_8$  over  $\mathbb{Z}[i]$  via Construction A over the extended Hamming code  $[8, 4, 4]$ , the canonical four-bit quotient  $L/(1+i)L \cong \mathbb{F}_2^4$ , and the  $G_{31}$  quartic companion (exact algebra, machine-certified); **N2. note\_hilbert\_polya\_truncations** — a computable, zeta-free truncation family for the Weil measure: measurements on a Hilbert-Pólya candidate (prediction-freeze methodology; no RH claim).

You are reading the introduction — the entry point and reading guide.

**TFPT status at a glance — read this card the same way in every document**

**Two inputs, one compiler.** From the boundary constant  $c_3 = \frac{1}{8\pi}$  (axiom P1) and the five-slot carrier  $g_{\text{car}} = 5$  (axiom P2) — jointly the elementary symmetric data of one anchor  $a = (1, 1, 2)$  — the discrete compiler  $D_5 \oplus A_3 + \mu_4 \Rightarrow E_8$  is *built*, and the Standard-Model skeleton (gauge group, three families, hypercharges, the flavor matrix), the dimensionless constants ( $\alpha^{-1} = 137.0359992$ ) and the scale grammar are read off as fixed points. The algebraic core is machine-checked; physical readouts run through *named bridges* whose status is typed below.

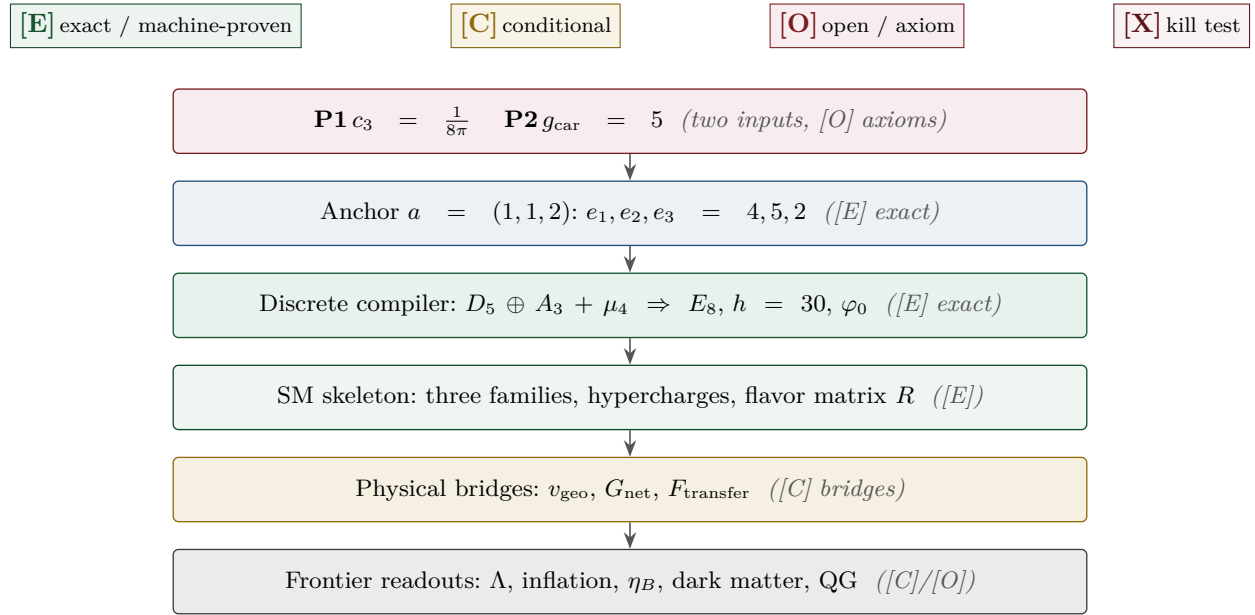

**What is closed, and what genuinely remains.** The discrete/algebraic layer is closed ([E]); the everything-open residual reduces to *three named interface problems*:

| Interface             | Question                                                                                        | Status        |
|-----------------------|-------------------------------------------------------------------------------------------------|---------------|
| $v_{\text{geo}}$      | the one metrology unit ( $= 1/\sqrt{G} = m/\mu$ ); No-Unit Thm: no compiler scale               | primitive [O] |
| $G_{\text{net}}$      | simple-current extension $(D_5)_1 \otimes (A_3)_1 \rtimes \langle (1, 1) \rangle \cong (E_8)_1$ | [C]           |
| $F_{\text{transfer}}$ | one functor, four typed interfaces (Koide, $\eta_B$ , axion, $m_p/m_e$ )                        | [C]           |

**Gravity is parameter-free.** The classical metric-sector field equation is no longer only an  $R+R^2$  readout: the fixed-volume entanglement equilibrium (Jacobson; Faulkner et al.), run with TFPT's atoms, gives the *full* covariant Einstein equation  $G_{ab} + \Lambda g_{ab} = c_3^{-1} T_{ab}$  with *both* coefficients fixed —  $c_3^{-1} = 8\pi$  (no free dimensionless Newton dial; the thermodynamic origin  $2\pi/\eta$  *coincides* with the geometric one  $|\mathbb{Z}_2|2\pi\chi$  via  $|\mu_4| = |\mathbb{Z}_2|\chi(S^2) = 4$ , so  $c_3$  is triply over-determined — anchor, geometry, thermodynamics, v358) and  $\Lambda$  from  $\alpha$  ( $\rho_\Lambda = (3/4\pi^2)e^{-2\alpha^{-1}}$ , v60); the Einstein tensor (not Ricci) is forced by Lovelock, so matter conservation is an output (v359). The residual here is only the equation-of-state status (an external candidate action — Bianconi's entropic action, arXiv:2408.14391 — is quantified in v473 without changing the typing) and the one unit  $v_{\text{geo}}$ ; the global measure (C7 = QG.AMB.01) is now a [C] redundancy (v369), a certification object rather than missing dynamics, conditional on SEAM.EQUIV.01 and Bisognano–Wichmann.

The seam-net structural theorem  $G_{\text{net}}$  (= SEAM.EQUIV.01: the raw seam *is* the holomorphic  $(E_8)_1$  net) now carries two named routes (route split 2026-07-22, no status change in substance): the MMST route SEAM.EQUIV.MMST.01 is *closed modulo cited theorems*; the twistor route SEAM.EQUIV.TWISTOR.01 (Costello–Li, prepared by CELEST.SEAM.01) and the unconditional parent stay [O]. On the MMST route: the explicit lattice model (v367/v368) and the  $S_3$  closure stack pin the target at every computable level — central charge  $c = 8$  (v376), the  $(E_8)_1$  character with 248 currents and one primary (v377), genus-one torus  $\text{GSD} = 1$  (v378) and reflection positivity (v379) — and it is Lean-formalised as FORM.SEAM.MMST.01: the collar's MMST hypotheses are kernel-proved, the MMST scaling-limit and Adamo–Moriwaki–Tanimoto OS-reconstruction theorems enter as named cited axioms, and the **#print axioms** check is clean. The *only* residual of that route that stays [O] is the abstract continuum existence of the scaling limit (v336) — its 128-spinor extension leg since certified at net level by the peer-reviewed crossed-product package ( $h_s=16/16=1 \in \mathbb{Z}$ , the Longo–Rehren locality criterion; Böckenhauer; KLM  $\mu=4/2^2=1$ ; AGT/AMT the independent second witness) with the realisation input reduced to invariant level and the parallel Lean route **seamResidualClosed'** (v469); so the MMST route is *closed modulo cited theorems*, not solved. QGEO.SYM.01 (the  $\mu_4$  deck acting geometrically) is its *corollary*: a conformal net's vacuum is rotation-invariant by axiom, so the deck follows with no extra premise (v335, Lean FORM.QGEO.BW.01). The nonperturbative quantum-gravity measure QG.AMB.01 is no longer carried as an open item: it is a [C] *redundancy* (v369), a certification object rather than missing dynamics, conditional on SEAM.EQUIV.01 and Bisognano–Wichmann (and TFPT is moreover rigorously gap-decoupled from the general Euclidean-QG conformal-factor problem, margin  $1.648 > 0$ , v76/v330). So the honest residual is the one unit  $v_{\text{geo}}$  plus the typed  $F_{\text{transfer}}$  interfaces, above the cited-theorem ceiling on the seam and with QG.AMB.01 a [C] redundancy. Everything carries a claim ID resolving to a row of **verification/status\_ledger.csv** (the single source of truth); **if the text and the ledger ever disagree, the ledger wins**. The historical labels ( $U_{\text{wall}}, G_{\text{metric}}, F_{\text{frontier}}$ ) are retained only for ledger continuity — the live residual is  $v_{\text{geo}} \oplus F_{\text{transfer}}$ , with the seam  $G_{\text{net}}$  closed modulo cited theorems on its MMST route (parent [O]) and QG.AMB.01 a [C] redundancy.

Marker key: [E] exact / machine-proven · [C] conditional (holds under named hypotheses) · [O] open / axiom · [X] falsifiable kill test. Per-claim fine type in **verification/status\_ledger.csv**.

**Reading the markers.** Claims carry one of *four* reader-facing classes, so one can see at a glance what is proven and what is conditional: **[E]** *exact / machine-proven* — an exact identity (e.g.  $240 = 16 \cdot 5 \cdot 3$ ), a Lie/lattice theorem (e.g.  $D_5 \oplus A_3 + \mu_4 = E_8$ ), a Lean/script formalisation, or a reproduced numerical fixed point; **[C]** *conditional* — follows under explicitly named hypotheses (a physical bridge, readout or pending step); **[O]** *open / axiom* — a declared input or a genuine gap; **[X]** *kill test* — a falsifiable threshold. The finer per-claim type (Axiom / Formal / Lattice /

Numerical / Identity / Physical) is kept in `verification/status_ledger.csv`, the single source of truth.

|                                    |                                              |
|------------------------------------|----------------------------------------------|
| Physical — under hypotheses        | RG masses, QG    QG.AMB.01                   |
| Numerical — fit-free fixed point   | $\alpha^{-1}, \Lambda, \theta_{12}$ EM.FP.01 |
| Lattice — Lie / glue / root system | $E_8=(D_5\oplus A_3)+\mu_4$ E8.GLU.01        |
| Formal — Lean / exact script       | P2 algebra    FORM.P2.02                     |
| Axiom — declared inputs            | P1 $c_3$ , P2 $g_{\text{car}}$ AX.P1.01      |

The *claim stack* (bottom = most certain/fewest, top = conditional). Each claim sits on exactly one level; the bottom two are inputs, the middle two are proved/reproduced, only the top is conditional. The single source of truth for which claim sits where is `verification/status_ledger.csv`.

**No-free-pattern rule.** To keep the structure from drowning in decorative coincidences, an identity enters the *main text* only if it (1) is a necessary step in a derivation, (2) kills an alternative, (3) is ablation-relevant, (4) links two previously independent modules, or (5) is experimentally tested. Everything else is explicitly demoted to an *audit fingerprint* [E] (clearly boxed as such) — so the load-bearing beams stay visible and the ornament never gets promoted to spine.

**Admissible-invariant classes (the harder filter).** Sharper still: a *load-bearing* integer may only come from one of seven typed sources — (i) a symmetric function  $e_k(a)$  of the anchor  $a = (1, 1, 2)$ ; (ii) a power sum  $p_n(a)$  or difference  $p_{n+1}-p_n$ ; (iii) a determinant, spectrum, Smith normal form or trace of  $(R, Q, K, L)$ ; (iv) an anchor quadratic form  $u^\top M v$  with  $u, v \in \{1, a\}$ ; (v) a Plücker coordinate of the anchor plane  $\langle 1, a \rangle$ ; (vi) an  $E_8$  Casimir degree or branching block; (vii) a pre-registered experimental observable. Anything else is an audit fingerprint or a frontier item, never spine. This is what converts TFPT from *pattern hunting* (“look, another number”) into a typed compiler: *fewer admissible kinds of explanation*, not more matches.

**Reviewer path** (read in this order; the rest is support):

1. the architecture: the two axioms  $\{c_3, g_{\text{car}}\}$  and the two-engine picture (§1, the figures);
2. the  $E_8$  glue  $E_8=(D_5\oplus A_3)+\mu_4$  — document 1, Part II, machine-checked (`v1_e8_glue.py`);
3. the  $\alpha^{-1}$  fixed point plus ablation (`v3_em_alpha.py`);
4. the **single status ledger** `verification/status_ledger.csv` — the source of truth for every claim’s grade, location, dependency and script;
5. the **open gates** as numbered research contracts (`tfpt_research_contracts`: the residual classes R1–R5 and their current reductions) and the honest frontier list (document 4).

Everything carries a claim ID (e.g. E8.GLU.01, EM.FP.01) that resolves to a row of the ledger. **If the text and the ledger ever disagree, the ledger wins.**

## 1 What this is about: the jump in construction principle

### In plain words

**What we found.** TFPT reproduces dozens of real numbers of physics (particle masses, the fine-structure constant, dark-energy and inflation values) from a small set of inputs — and the compiler closure says *why* the same handful of small integers (2, 3, 5, 16, ...) reappears in every sector: those numbers are not separate lucky hits. A single tiny “machine” — fed by just **two inputs** (a boundary number  $\frac{1}{8\pi}$  and a five-slot carrier) — builds the exceptional symmetry  $E_8$ , and  $E_8$  is the unimodular “audit hull” that classifies the discrete Standard-Model readout: the constants, the flavor skeleton and the gravity/cosmology regime are then read off by projection and

boundary dressing (not “printed” for free — where a scheme or analytic interface is needed, it is named).

**Why this is simple.** There are not many separate derivations that happen to share numbers — there is *one generator and a handful of corollaries*, and the number of independent structural assumptions is **two**.

**How plausible it is.** A theory becomes more believable when it *explains more from less*. Here the two inputs are even *over-determined*: the machine reproduces the very two numbers it started from (the dashed bootstrap loop in the architecture diagram, §2), so there is *no free dial left to tune*. Pushed to the end ([[verification/v353\\_selfloop\\_capstone.py](#)]), this means TFPT is best read not as a *linear* theory (axioms  $\rightarrow$  theorems) but as a *closed self-consistent loop* whose outputs fix its own inputs ( $g_{\text{car}}=5$  is the largest prime of the output  $h(E_8)=30$ ; the 8 in  $c_3$  is rank  $E_8$ ), with a *unique* fixed point ([v6/v56](#)) and *zero* free adjustable dimensionless parameters. Even  $\pi$  is not a free dial: it is the fixed geometric constant of the boundary 2-sphere ( $\oint_{S^2} K = 4\pi$ ), the one transcendental the continuous boundary contains. “Which is the axiom?” is the wrong question for a loop — every part is fixed by the whole; the one remaining structural question, whether the loop also closes in the *continuum* (the keystone [SEAM.EQUIV.01](#)), now carries two named routes (route split 2026-07-22, an ID restructuring with *no* status change in substance): its MMST route [SEAM.EQUIV.MMST.01](#) is *closed modulo cited theorems* — the lattice model and  $S_3$  stack pin it at every computable level and it is Lean-formalised ([FORM.SEAM.MMST.01](#)); only the cited continuum-existence theorems stay [\[O\]](#) ([v367/v368](#), [v376–v379](#), [v336](#)), their extension leg since re-founded on peer-reviewed crossed-product theorems with the realisation input reduced to invariant level ([v469](#)) — while its twistor route [SEAM.EQUIV.TWISTOR.01](#) (the open Costello–Li construction, prepared by [CELEST.SEAM.01](#)) stays [\[O\]](#); the parent [SEAM.EQUIV.01](#) is closed if either route closes and, as an unconditional claim, stays [\[O\]](#).

**Sharper still: one anchor  $a = (1, 1, 2)$ , and  $E_8$  as a compiler hull ([E])**

The two axioms are not even independent: they are the *elementary symmetric polynomials* of the single parabolic anchor  $a = (1, 1, 2)$  (the exponents-at-infinity / splitting type  $\mathcal{O}(-2) \oplus \mathcal{O}(-1)^2$ ):

$$e_1(a) = 4 = |\mu_4|, \quad e_2(a) = 5 = g_{\text{car}}, \quad e_3(a) = 2 = |\mathbb{Z}_2|, \quad c_3 = \frac{1}{2e_1(a)\pi} = \frac{1}{8\pi}.$$

Its *power sums*  $p_n(a) = 1^n + 1^n + 2^n = 2 + 2^n$  generate the big Lie data directly:  $p_1=4=|\mu_4|$ ,  $p_2=6=|R^+(A_3)|$ ,  $p_3=10=\mathcal{A}_\Lambda$ , and

$$|R(E_8)| = p_1 p_2 p_3 = 240, \quad \dim E_8 = p_1 p_2 p_3 + (p_4 - p_3) = 248, \quad p_4 - p_3 = 8 = \text{rank } E_8,$$

with the binary ladder  $p_{n+1} - p_n = 2^n$ . So the inputs collapse from  $\{c_3, g_{\text{car}}\}$  to  $\boxed{a = (1, 1, 2) \text{ plus } \pi}$ . [[verification/v23\\_anchor\\_generator.py](#)]

And  $a$  is itself *half-forced* ([E]/[C]): on  $\mathbb{P}^1$  every bundle splits (Birkhoff–Grothendieck), so once  $|\mu_4| = 4$ ,  $N_{\text{fam}} = 3$ ,  $\deg E = -4$  are set, the three positive anti-degrees are positive integers summing to 4, and  $4 = 2 + 1 + 1$  is the *unique* partition into three positive parts — machine-checked with all its negative controls as the partition corollary ([[verification/v491\\_p2\\_partition\\_corollary.py](#)], [P2.PARTITION.01](#)): the unique multiset  $\{1, 1, 2\}$  forces  $e = (4, 5, 2)$ , hence  $g_{\text{car}} = e_2 = 5$ ,  $|\mathbb{Z}_2| = e_3 = 2$ ,  $N_{\text{fam}} = 3$  as *corollaries* (dropping positivity, the sum, the part count or integrality each destroys uniqueness — Mehta–Seshadri-rational weights give  $e_2 = \frac{16}{3}$  or  $\frac{44}{9} \neq 5$ ), sharpening [v53](#) which needs all three targets. The typing itself is now hardened ([[verification/v499\\_p2\\_weights\\_deligne\\_bg.py](#)], [P2.TYPING.01](#)): given the four marks, rank 3, the cusp class and unitarity (U), the Deligne canonical extension of the flavor connection has  $\deg E = -4$  (residue traces) and Mehta–Seshadri stability forces  $h^0(E) = 0$ , so integrality (Birkhoff–Grothendieck), positivity and the sum 4 are *theorems* — the residual shrinks to the module identification and (U), both [\[C\]](#); and that module-identification rest

is now *one* residual with the QGEO modulus rest (the order-4 clock = the Coxeter/cusp-class carrier datum; [verification/v503\_qgeo\_emergence\_light.py], QGEO.EMERGE.LIGHT.01, no marker moves). That common residual is itself now reduced to *one alignment bit* — the collar deck central in the mark- $D_4$ ; the clock's *order* is fermionically forced,  $U^2 = (-1)^F$  exactly ([verification/v506\_seam\_clock\_rigidity.py], SEAM.CLOCK.RIGIDITY.01, markers unchanged); and the bit is no tautology — the deck's *class* is derived (every mark-free collar deck is a half-period translation of the seam double), only its *position* stays the [C] input ([verification/v507\_seam\_bit\_origin.py], SEAM.BIT.ORIGIN.01, markers unchanged); and that position half is now *topology* — the covering deck is free on the seam circle, the edge class is excluded, and the bit reduces to the square-modulus datum  $\tau = i$  alone ([verification/v510\_seam\_bit\_freedom.py], SEAM.BIT.FREEDOM.01, markers unchanged); and that modulus datum now carries an equivalent *discrete* form — flag transitivity of the four marks (marks *and* their two sides indistinguishable,  $V_4 \rightarrow D_4$ )  $\iff \tau = i$ , a 13-fold exact equivalence web (since 15-fold by v528 facets #14/#15) in which bare mark-transitivity is automatic for every configuration and no local jet sees the side bit ([verification/v512\_seam\_tau\_flag.py], SEAM.TAU.FLAG.01, markers unchanged); free OS positivity is since documented as the *eighth* side-blind test on that scoreboard — the bit is not derivable from free RP/ $\Theta$  existence and remains genuine discrete input (v521, SEAM.BIT.RPBLIND.01, markers unchanged); the mark-decorated *state* class (twist/defect insertions — everything Wick-computable) is since documented as the *ninth*: the free-plus-twist class is exhausted (v525, SEAM.BIT.TWISTBLIND.01, markers unchanged); and the first genuinely interacting Fidkowski–Kitaev seam toy is the *tenth* side-blind test ( $9 \rightarrow 10$ ), while Kill-Test 2 fires at toy level under a typed fence (v529, SEAM.INT.FKTOY.01, markers unchanged); the straddle filter it produced, since run as a *selector* on the interacting mark family, keeps exactly *one* member alive — reflection positivity dynamically selects  $\delta = \pi/2$  with positive coupling, the same member that carries the twist-class order parameter: the first *positive* selection datum for the bit (v534, SEAM.STRADDLE.CONE.01, markers unchanged; toy-level evidence, not a derivation); the straddle law itself is since refined to the *odd-split law* — the Jaffe–Pedrocchi reflection-positivity condition, made decidable on the toy, predicted RP survival on center-straddled (2+2) cuts and direct measurement confirmed it: a straddled cut kills RP iff the split is odd (1+3) — while the quartet-avoiding cut family generates the full even seam algebra and carries a *positive* OS/GNS inner product at  $g = 1$ : the Kill-Test-2 counterweight is narrowed (an OS-viable cut geometry selected by the toy's own clock), not removed ([verification/v972\_seam\_interaction\_front.py], toy level, fence inherited, markers unchanged). The bit itself is now the *twist-class choice*, in principle interferometrically readable (v528, SEAM.BIT.TWISTCLASS.01; it remains formal input). Temperature joins geometry and anomaly as the *third leg* of  $c_3$  (v526, SEAM.THERMAL.KMS.01, [C]-typed reading). The genuine remaining axiom is therefore not “why  $a = (1, 1, 2)$ ” but “why the carrier  $g_{\text{car}} = 5 / (|\mu_4|, N_{\text{fam}}) = (4, 3)$ ” — that interface (with  $c_3$ ), i.e. the weight-*typing* postulate itself, is the [O] input layer (AX.P2.01 stays a declared axiom). The consolidated reduction state (2026-07-23): the compiler's dimensionless inputs reduce to *four marks* (derived from P1-side topology), *one discrete symmetry-lift bit* — the twist-class choice (flag transitivity  $\iff \tau = i$ ; equivalently the clock, the CM-fixed half-period, or the non-split extension class on the free seam circle) — and  $\pi$  — a reduction state, not an abolition of the axiom: AX.P2.01 remains declared, and the [C] identifications R1/R2 of v499 remain conditional.

*Two readings, one source (no contradiction).* P1 and P2 are the *operational compiler inputs*; their anchor provenance is  $a = (1, 1, 2)$  plus  $\pi$ . The *single structural bedrock postulate* is the keystone SEAM.EQUIV.01, whose conformal-deck face QGEO.SYM.01 (the carrier  $\mu_4$  clock is the seam's conformal deck, see tfpt\_research\_contracts) forces the  $\mu_4$  deck, hence  $N_{\text{fam}} = 3$ ,  $\deg E = -4$  and the tripartition  $4 = 2+1+1$ , of which  $c_3$  and  $g_{\text{car}}$  are the two elementary readouts. “Two inputs” (the working axioms) and “one postulate” (the geometric bedrock) are the same statement at two layers. Its geometric normal form and the mark-local  $\Rightarrow \omega \circ \rho = \omega$  implication are now Lean-formalised (FORM.QGEO.02/FORM.QGEO.01); the postulate itself stays [O].

*One source, four readings (the cleanest origin).* The four-point seam divisor  $\mu_4$  on  $\mathbb{P}^1$  generates the

whole discrete skeleton by four canonical functors:

$$\underbrace{c_3 = \frac{1}{8\pi}}_{\text{thermal}} \quad \underbrace{\text{rank } H_1(\mathbb{P}^1 \setminus \mu_4) = 3 = N_{\text{fam}}}_{\text{cycles} \rightarrow A_3} \quad \underbrace{h^0(\mathbb{P}^1, \mathcal{O}(\mu_4)) = 5 = g_{\text{car}}}_{\text{functions} \rightarrow D_5}$$

$$\underbrace{(D_5)_1 \otimes (A_3)_1 \rtimes \mu_4 \cong (E_8)_1}_{\text{net}}$$

and the function side even generates  $D_5$  itself ([`verification/v197_rr_carrier_clifford_d5.py`]):  $\Lambda^{\text{even}}(\mathbb{C}^5) = \binom{5}{0} + \binom{5}{2} + \binom{5}{4} = 16 = \dim S^+$ , the  $\mathfrak{so}(10) = D_5$  half-spinor. So  $\mu_4$  is not merely glue: it is the *common source* of  $A_3$ ,  $D_5$ ,  $c_3$  and  $E_8$  ([`verification/v189_riemann_roch_carrier.py`]) — the arithmetic is exact [E], the physical reading of the carrier as the seam mode space stays [C].

**What  $E_8$  is (and is not).** In TFPT  $E_8$  is *not* an unbroken physical gauge group: it is the unimodular *audit / compiler hull* that classifies the admissible discrete charge and residue structures. The Standard Model is a *readout* after projection, not a direct  $E_8$  gauge theory; the Lorentz signature appears only after projection; fermions are not “everything in the adjoint”. This is exactly why the known no-go results against literal  $E_8$  world-formulas (Distler–Garibaldi; Coleman–Mandula) do *not* bite: they constrain  $E_8$  as a spacetime gauge symmetry, which TFPT does not claim. The defensible claim is: *TFPT is the unique parabolic compilation of the anchor  $a = (1, 1, 2)$  into the  $E_8$  audit hull.*

In one line:

The anchor generates the syntax; the boundary generates the scale;  $E_8$  checks the consistency.

i.e. the discrete content (carrier  $D_5 \oplus A_3 + \mu_4$ , the operators  $R, Q, K, L$ ) flows from  $a = (1, 1, 2)$ ; the continuous content ( $c_3 = \frac{1}{8\pi}$ ,  $\varphi_0$ ,  $\alpha^{-1}$ , the exponential scales) flows from  $\pi$ ; and  $E_8$  is the unimodular *checksum container*, not the world group.

**The anchor ratio triad** ([`verification/v119_review_validation_2.py`]). The three elementary symmetric values, normalised by the family count, are the theory’s three recurring fractions [E]:

$$\frac{e_3}{p_0} = \frac{2}{3} \text{ (Koide branch / sheet ratio), } \quad \frac{e_1}{p_0} = \frac{4}{3} \text{ (seed gain), } \quad \frac{e_2}{p_0} = \frac{5}{3} \text{ (carrier branch)}$$

— the canonical flow’s critical points are exactly  $(2, 5) = (e_3, e_2)$  with inflection  $\frac{7}{2} = \frac{e_3 + e_2}{2}$ : the fractions  $\frac{2}{3}, \frac{4}{3}, \frac{5}{3}$  are not scattered numbers but the three normalised anchor coefficients. Further micro-identities [E]:  $\Omega_{\text{adm}} = 2p_1p_2 = 48$ ,  $10b_1 = 1 + p_1p_3 = 41$ ,  $\Delta_Y = e_2^2 = p_0^2 + 2 \text{rank } E_8 = 25$ ,  $h(E_8) = e_3p_0e_2 = 30$ ,  $\text{rank } E_8 = p_0 + e_2$ .

$$a = (1, 1, 2) \quad [E]$$

#### elementary $e_k(a)$

$$\begin{aligned} e_1 &= 4 \rightarrow |\mu_4| \\ e_2 &= 5 \rightarrow g_{\text{car}} \\ e_3 &= 2 \rightarrow |\mathbb{Z}_2| \\ c_3 &= \frac{1}{2e_1\pi} = \frac{1}{8\pi} \end{aligned}$$

#### power sums $p_n = 2 + 2^n$

$$\begin{aligned} p_0, p_1, p_2, p_3 &= 3, 4, 6, 10 \\ p_1p_2p_3 &= 240 = |R(E_8)| \\ p_4 - p_3 &= 8 = \text{rank } E_8 \\ \Rightarrow \dim E_8 &= 248 \end{aligned}$$

#### derived motifs

$$\begin{aligned} &4, 5, 8, 16, 25, \\ &30, 41, 120, 240 \\ &\text{one anchor,} \\ &\text{many projections} \end{aligned}$$

## The companion documents

The whole development is consolidated into **eight companion documents** (plus this introduction), organised in layers that build on one another; this introduction is the entry point and reading guide. Each document collects the material of its layer into self-contained parts:

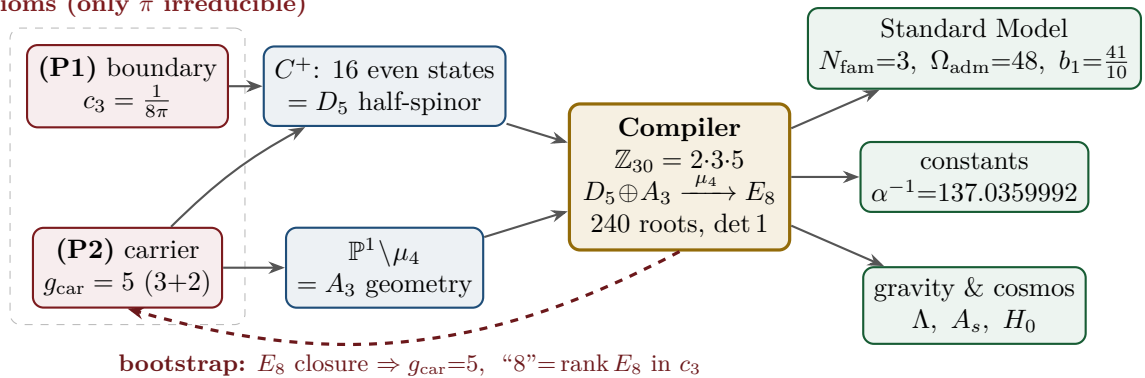

| Document                          | What it contains (former notes now as parts)                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tfpt_1_architecture_e8            | <b>Core.</b> The two axioms $\{c_3, g_{\text{car}}\}$ , the derivation map and the EM fixed point (Part I); the Coxeter–cyclotomic compiler $\mathbb{Z}_{30}=2\cdot3\cdot5$ , the explicit $D_5\oplus A_3+\mu_4$ $E_8$ construction, the machine-checkable $E_8$ appendix and the group-level glue $(\text{Spin}(10)\times SU(4))/\Delta\mathbb{Z}_4$ (Part II).                                                                        |
| tfpt_2_standard_model             | <b>Standard Model.</b> The full SM in one $\varphi_0^{\text{ret}}$ -ladder formula (Part I); the flavor block from parabolic weights and the transport theorem, H2 as a spectral selector (Part II); the worked closures — explicit gap, APS–Fredholm, truncation/ $n_s, r$ , Starobinsky $M$ , derived $\theta_{12}$ , quark $c$ , the H2 splitting type, $\Lambda$ -typing (Part III).                                                |
| tfpt_3_e8_audit_bootstrap         | <b><math>E_8</math> audit &amp; bootstrap.</b> The seven $E_8$ slices as an audit raster ( $E_6\times A_2$ reads the flavor matrix) (Part I); the old cascade $D=60-2n$ as the same even-integer spine (Part II); the Möbius bootstrap — $g_{\text{car}}=5$ and the “8” in $c_3$ as overdetermined fixed points, only $\pi$ irreducible (Part III).                                                                                     |
| tfpt_4_frontier                   | <b>Frontier.</b> The honest status of $\eta_B$ , $m_p/m_e$ , Koide, dark matter and quantum gravity — the genuine handle, the precision, and what is <i>not</i> forced onto the ladder.                                                                                                                                                                                                                                                 |
| tfpt_5_redteam                    | <b>Red Team.</b> The adversarial audit of the five load-bearing reductions (Targets A–E): the declared attacks, what survives each, what each one reduces to, and the explicit kill tests.                                                                                                                                                                                                                                              |
| tfpt_research_contracts           | <b>Research contracts.</b> The open gates as numbered contracts with lemma chains and closing theorems: ( $U_{\text{wall}}$ ) (now reduced to the selector triangle: $(d, n) \Rightarrow R$ columnwise, residue = <i>two</i> line pairings, the third integrality-forced) and $G_{\text{metric}}/G_{\text{net}}$ (the index-4 seam-net identification — one theorem, three doors, now realised at the finite Lie level).                |
| tfpt_horizon_readouts<br>(App. H) | <b>Appendix H — horizon unit system (reframe, not new physics).</b> One seam constant $c_3=\frac{1}{8\pi}$ as the universal horizon thermal code: Hawking/de Sitter/Unruh, BH thermodynamics, Page, scrambling, Nariai bound, $v_{\text{GW}}=c$ — standard physics in seam units, two compiler fingerprints ( $1920= W(D_5) $ , $ \mu_4 =4$ ); plus the Nariai/anchor surface, the dual anchor and the resummed seam clock (v101–v138). |
| origin_theory                     | <b>Origin Theory.</b> Why no free <i>dimensionless compiler dial</i> remains beyond the anchor and $\pi$ (the dimensionful $v_{\text{geo}}$ and transfer physics stay typed): the $(g_{\text{car}}, N_{\text{fam}})$ skeleton, the triply-forced 8, the order-30 Coxeter cycle, one boundary transport for flavor and horizon, the gapped unique attractor; [E] core plus one honestly-typed [C] cyclic interpretation.                 |

The five formerly “research-level” problems are now *closed, reduced or typed* inside the documents where they belong — the group-level closure  $(\text{Spin}(10)\times SU(4))/\Delta\mathbb{Z}_4$  in document 1 (closed), and the H2 splitting type, the Starobinsky scalaron mass, the  $\theta_{12}$  texture and the quark  $c$  in document 2 (the first two closed; the quark *ratios* now closed combinatorially (v49/v71), only the *absolute* scale a  $U_{\text{point}}$  anchor;  $\theta_{12}$  the seam-misalignment residual). Eight companion files (plus this introduction), each result where it logically lives.

## 2 The architecture at a glance

The diagram below shows the whole pipeline: *two* inputs on the left, the discrete compiler in the middle, the physics on the right. Everything in between is a consequence.

2 axioms (only  $\pi$  irreducible)

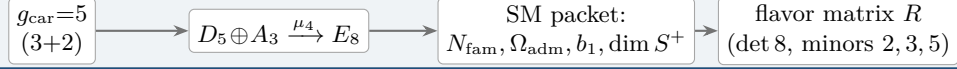

**Key statement (the loop closes):** previously  $D_5$ ,  $A_3$  and  $E_8$  sat *as given* Lie structures in the background. Now they are *intermediate products* of the two inputs — *and the red back-channel is the new part*: the  $E_8$  closure feeds back and *fixes the inputs*.  $g_{\text{car}} = 5$  is the unique rank-fill/Coxeter/Pascal solution ( $2^{g-1} = \binom{g}{0} + \binom{g}{1} + \binom{g}{2}$ ), and the integer 8 in  $c_3 = \frac{1}{8\pi}$  is rank  $E_8 = h(D_5) = \det R$ . **Inputs and output form an overdetermined fixed point** — the structure does

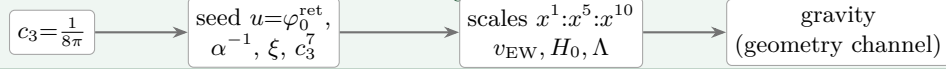

not “prove itself”; it has fewer degrees of freedom than independent consistency conditions. The only thing *not* produced by the loop is the continuous  $\pi$  (Möbius/Gauss–Bonnet), the lone irreducible primitive. So it is not a one-way arrow chain but a closed, overdetermined self-consistency loop.

**The master story is two engines.** Read from the two axioms, the whole theory factorises into exactly *two* engines — a *discrete* closure and a *boundary* dressing. Gravity is not a third block; it is the geometry channel of Engine 2.

### Engine 1 — discrete closure (from $g_{\text{car}} = 5$ )

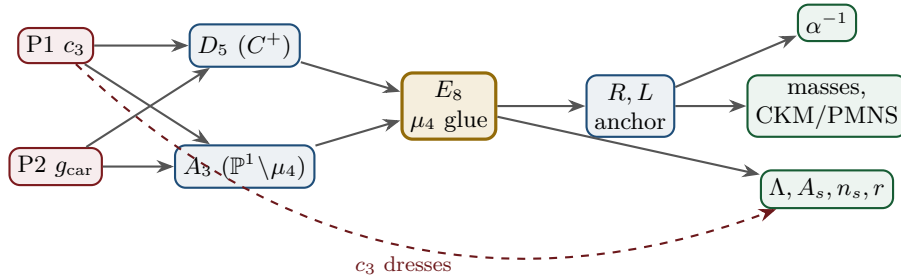

### Engine 2 — boundary dressing (from $c_3 = \frac{1}{8\pi}$ )

## 3 The dependency DAG and the proof ledger

The whole theory is a directed acyclic graph: two axioms at the source, the compiler in the middle, the observables as sinks. The DAG makes the attack surface explicit — each arrow is a named theorem or a declared input, and each node fails in exactly one way.

| Node           | Definition                                               | Inputs      | St.     | Output                              | Failure mode                |
|----------------|----------------------------------------------------------|-------------|---------|-------------------------------------|-----------------------------|
| P1             | RP boundary kernel, $c_3=1/(8\pi)$                       | — (axiom)   | [O]     | $c_3$                               | no reflection-positive seam |
| P2             | 5-slot carrier $g_{\text{car}}=5$                        | — (axiom)   | [O]     | carrier 3+2                         | wrong family/charge lattice |
| $D_5$          | $C^+$ even-Hamming = half-spinor 16                      | P2          | [E]     | $\dim S^+=16, Y$                    | group/matter mismatch       |
| $A_3$          | $\mathbb{P}^1 \setminus \mu_4$ four-puncture geom.       | P1          | [E]     | $N_{\text{fam}}=3, \mathbb{Z}_6$    | wrong multiplicity          |
| $E_8$          | $\mu_4$ glue: $\text{disc}=\mathbb{Z}_4, q\text{-sum}=2$ | $D_5, A_3$  | [E]     | 240, 248                            | not even-unimodular         |
| $R, L$         | residue + winding matrix, anchor (1, 1, 2)               | $A_3$       | [E]     | $\det 8, \text{ minors } (2, 3, 5)$ | wrong $D_6$ branch          |
| $\alpha^{-1}$  | root of $F_{U(1)}(\alpha)=0$                             | $c_3, M=41$ | [E]     | 137.0359992                         | no/second root (excl.)      |
| masses         | $\varphi_0^{\text{ret}}$ -ladder $\lambda_V^L \Lambda$   | $R, L, c_3$ | [E]/[C] | 9 masses, mixings                   | hierarchy mismatch          |
| $\theta_{12}$  | TBM + seam $\varepsilon=c_3$                             | $R, L$      | [E]/[C] | 0.307                               | seam-misalign. lemma fails  |
| $\Lambda, A_s$ | seam det. / $R^2$ scalaron                               | $c_3$       | [C]     | $\Lambda, A_s, n_s, r$              | ambient RP fails            |

Marker key: [E] exact / machine-proven · [C] conditional (holds under named hypotheses) · [O] open / axiom · [X] falsifiable kill test. Per-claim fine type in verification/status\_ledger.csv.

Reading the table top-to-bottom is reading the theory: two red axioms in, everything else a consequence with exactly one failure mode each.

The ledger itself is versioned: each row of `verification/status_ledger.csv` carries a claim ID, its dependencies, its verification script, and `active/canonical_status/supersedes` fields, so claims that were later superseded (e.g. the early “flavor gate open” rows, now *ratios closed* via `FLAV.RIGID`) are marked inactive — the canonical status is the only one read as current.

## The compact status formula: three honest layers

$$\underbrace{\text{compiler}}_{\text{closed}} \mid \underbrace{\text{admissible IR physics}}_{\text{conditionally closed (RP, gap)}} \mid \underbrace{\text{strict physical TOE}}_{\text{open}}$$

TFPT v5.4 closes the discrete compiler, the algebraic Standard-Model readout, the EM fixed point, the admissible gapped IR sector and the  $R + R^2$  spectral-action shadow. It does *not* yet certify a strict physical TOE. The remaining items have now collapsed sharply: the  $R$ -bridge amplitude normalisation  $U_{\text{point}}$  *reduces to*  $v_{\text{geo}}$  (Gate 1 closed, [v75](#) — the same anchor as  $1/G$ ), and the ambient metric measure is *holographically reduced* to a finite seam-boundary measure (Gate 2 tier B, [v76](#)) — which is in turn the rigorously-constructed  $(E_8)_1$  lattice net ([v77](#)), so  $G_{\text{metric}}$  is imported into existing RCFT rigor rather than built anew. So the only genuine residuals are *one* dimensionful scale  $v_{\text{geo}}$  — the *dimensional-analysis floor* that no theory escapes ([v78](#)), shared by flavor and gravity — the boundary net identification (now *closed modulo cited theorems* on its MMST route `SEAM.EQUIV.MMST.01`, [v367/v368](#), [v376–v379](#), Lean `FORM.SEAM.MMST.01`; the parent `SEAM.EQUIV.01` stays [\[O\]](#)), and the named QFT/cosmology transfer interfaces ( $F_{\text{frontier}}$ ).

**Two points that are *not* in the residual (closed, but easy to mis-list as open).** (i) *Parameter-freeness is a theorem under the named hypotheses*: the boundary transport is gapped ( $\Delta = 6 \log \frac{3}{2} > 0$ ), so by Perron–Frobenius its iteration has a *unique* attracting fixed point — the constants are *selected*, not tuned ([\[E\]](#) for the attractor, [\[verification/v56\\_unique\\_attractor.py\]](#); the *physical identification* of the transport operator stays [\[C\]](#)), reinforcing the static bootstrap web ( $g_{\text{car}} = 5$  forced three ways *given* the  $E_8$  closure rank — a consistency loop, see red team Target B — [\[verification/v6\\_bootstrap.py\]](#), [\[verification/v14\\_carrier\\_uniqueness.py\]](#)). (ii) *Newton’s constant is not an independent input*: fixing the physical  $\Lambda$  branch ( $(8\pi)^2 \delta_{\text{top}} = \frac{3}{4\pi^2}$ ) pins  $\bar{M}_{\text{Pl}}$  relative to  $\Lambda$ , so  $G_N$  is read out *after* the branch choice + *one* dimensionful induced-gravity anchor ([\[E\]/\[C\]](#), [\[verification/v60\\_lambda\\_metrology\\_branch.py\]](#)), not predicted from pure numbers. What stays irreducible is then just  $\pi$ , the discrete  $E_8$ -closure fixed point (self-consistent, *not* a free axiom; the bootstrap of `tfpt_3`), and *one* dimensionful scale  $v_{\text{geo}}$  — and that single scale is shared by *both* the flavor sector ( $U_{\text{point}} \rightarrow v_{\text{geo}}$ , [v75](#)) and gravity ( $1/G$ , [v68](#)): the two  $[A]$  anchors are *one* (dimensional analysis; no metre from pure mathematics).

## The hard reduction: the live residual as typed interfaces

After the compiler closure, the entire residual is

$$\text{Rest} = v_{\text{geo}} \oplus G_{\text{net}} \oplus F_{\text{transfer}}$$

— one dimensionful scale anchor, one metric-sector inclusion, and a set of deliberately typed QFT/cosmology interfaces (the historical gate labels  $(U_{\text{wall}})/(G_{\text{metric}})/(F_{\text{frontier}})$  are kept only for ledger continuity). In current terms:  $(U_{\text{wall}}) \rightarrow v_{\text{geo}}$  — the flavor ratios are *closed* (Plücker/Readout Rigidity, [v49/v71/v75](#)), what remains is *one dimensionful unit*, not a flavor gap;  $(G_{\text{metric}}) \rightarrow G_{\text{net}}$  — reduced to a single boundary-net theorem, “the seam–Calderón net is the index-4  $\mu_4$  simple-current extension of the carrier net” (holomorphy then follows, [v89/GATE.METRIC.06](#)); since the QBL chain ([v108–v113](#)) the *carrier choice rides on the same theorem*: the certified scalar kernel exists iff it pairs the sheets ([v110](#)), the certified channel counts the code identically ([v112](#)), pair transport is minimally complete ([v111](#)), and the one quasi-free kernel — rank =  $c$ : 5 carrier block, 8 seam hull — is the defining datum of the free net the gate already posits ([v113](#)), so closing  $G_{\text{net}}$  also closes the carrier selection [\[E\]](#);  $(F_{\text{frontier}}) \rightarrow F_{\text{transfer}}$  — named QFT/cosmology *transfer* interfaces (Koide source→pole,  $\eta_B$  Boltzmann, axion relic,  $m_p/m_e$ ), never compiler powers; the four are one typed

functor with a four-axiom contract (`CONTRACT.F.01`, [v213](#)) and *one shape* — each is a gapped relaxation to a unique attractor (the main-branch discrete→dynamic motif), with `F_pole` at the *seam* rate  $(2/3)^6$  and the other three external ([v303](#)). The metric-sector reduction lands on a *single named keystone*. The boundary inclusion  $G_{\text{net}}$  is the index-4  $\mu_4$  simple-current extension  $(D_5)_1 \otimes (A_3)_1 \rtimes \langle (1, 1) \rangle \cong (E_8)_1$  (Simple-Current Extension Theorem, [v154](#), exact: index 4,  $c=8$ ,  $\mu=1 \Rightarrow$  holomorphic  $\Rightarrow E_8$ ); net existence and full-cone reflection positivity are discharged to [\[E\]](#) ([v175](#)); and the **No-Unit Theorem** ([v153](#)) makes  $v_{\text{geo}}$  an irreducible metrology primitive ( $U_{\text{point}} \sim v_{\text{geo}}$ ,  $1/G \sim v_{\text{geo}}^2$ ,  $m/\mu = e^{3/4}$  — one unit in three dimensions). The flavor selector and Q-geometry residues are *derived* (no discrete freedom left). The *one* seam-side identification, packaged as the single named theorem `SEAM.EQUIV.01` — *the raw reflection-positive seam state is the holomorphic  $(E_8)_1$  net at  $\tau=i$*  — is now *closed modulo cited theorems on its MMST route* (`SEAM.EQUIV.MMST.01`; the twistor route `SEAM.EQUIV.TWISTOR.01` and the unconditional parent stay [\[O\]](#)); the explicit lattice model ([v367/v368](#)) and the  $S_3$  stack ( $c=8$ , 248 currents/1 primary, torus GSD=1, RP; [v376–v379](#)) pin it at every computable level, Lean-formalised as `FORM.SEAM.MMST.01`, with only the cited MMST/OS continuum-existence theorems left [\[O\]](#) ([v336](#)); its conformal-deck premise `QGE0.SYM.01` is its *downstream* definitional face (per [v323](#); the residual is Lean-pinned to named cited steps, [v308](#)). The sprint-by-sprint reduction that produced it is recorded in the changelog and in `tfpt_research_contracts`, not replayed here. The status card:

Marker key: **[E]** exact / machine-proven · **[C]** conditional (holds under named hypotheses) · **[O]** open / axiom · **[X]** falsifiable kill test. Per-claim fine type in `verification/status_ledger.csv`.

Card addendum (2026-07-22): the  $a = (1, 1, 2)$  residual now carries the consolidated P2 reduction state — the position half of the alignment bit is topology (v510) and the modulus half is one discrete symmetry-lift bit — the twist-class choice (flag transitivity  $\iff \tau = i$ , v512/v528), so the dimensionless compiler inputs read *four marks + one discrete symmetry-lift bit (the twist-class choice, in principle interferometrically readable; flag transitivity  $\iff \tau = i$ )* +  $\pi$  (AX.P2.01 stays a declared axiom).

The former structural open core, the *single* named keystone SEAM.EQUIV.01 (the  $G_{\text{net}}$  inclusion: the raw RP seam =  $(E_8)_1$  at  $\tau=i$ ), is now *closed modulo cited theorems on its MMST route* (SEAM.EQUIV.MMST.01; the twistor route SEAM.EQUIV.TWISTOR.01 and the unconditional parent stay **[O]**): the explicit lattice model (v367/v368) and the  $S_3$  stack ( $c=8$ , 248 currents/1 primary, torus GSD=1, RP; v376–v379) pin it at every computable level, it is Lean-formalised as FORM.SEAM.MMST.01, and only the cited MMST/OS continuum-existence theorems stay **[O]** (v336); its conformal-deck face QGEO.SYM.01 is a *corollary* (a conformal net’s vacuum is rotation-invariant by axiom, v323/[`verification/v335_seam_equiv_unify.py`]), not a second item.  $v_{\text{geo}}$  is an irreducible metrology unit and the frontier items are typed interfaces, not structural holes.  $G_{\text{net}}$  is heat-kernel grounded (G2: the spectral action gives  $R + R^2$  structurally) and *gap-decoupled* (G5:  $\Delta_{\text{eff}}=1.648>0$  isolates the closed admissible sector from the ambient), so the ambient measure QG.AMB.01 is no longer carried as an open structural item: it is a **[C]** *redundancy* (v369, conditional on SEAM.EQUIV.01+Bisognano–Wichmann), a certification object rather than missing dynamics — it does not affect any TFPT readout. Both are written up as numbered *research contracts* (lemma chains + closing theorem + machine-certifiability) in the companion `tfpt_research_contracts`, with priority on the  $v_{\text{geo}}$  scale anchor and the  $G_{\text{net}}$ /SEAM.EQUIV.01 inclusion theorem. [`verification/v36_spectral_action_g2.py`]

**Sharper still: the structural residual is *one* condition.**  $G_{\text{metric}}$ , the carrier P2 and the red-team Target A are not separate items: they are three provably-equivalent faces of the single condition “*the seam carries no nontrivial abelian sector*” — holomorphy ( $\mu$ -index 1), a homology-sphere seam link ( $\Gamma$  perfect  $\iff 2I$ , [`verification/v232_e8_kleinian_seam.py`]), exactly one 1-dim irrep ([`verification/v219_icosahedral_mckay.py`]) — all of which force  $E_8$  ( $\#(\text{mark-1}) = |H_1| = 1$  only for  $E_8$ ; holomorphic  $c = 8 = g_{\text{car}} + N_{\text{fam}}$  gives the unique even unimodular rank-8 lattice). In abelian Chern–Simons language this is the single integer step holomorphic  $\iff \det K = 1$ , the extension tower  $D_5 \oplus A_3(16) \rightarrow D_8(4) \rightarrow E_8(1)$  being anyon condensation (the Kitaev  $E_8$  state); the one analytic step “the free RP seam condenses the order- $|\mu_4|$  Lagrangian glue” = the single named keystone SEAM.EQUIV.01 (with QGEO.SYM.01 its downstream conformal-deck face) is now *closed modulo cited theorems* on its MMST route SEAM.EQUIV.MMST.01 (v367/v368, v376–v379, Lean FORM.SEAM.MMST.01; cited continuum existence **[O]**, v336; the parent SEAM.EQUIV.01 stays **[O]**). So beneath the gate *labels* there is, structurally, a single fundamental postulate. And the entire *emergent-QFT layer* collapses onto the *same* postulate (the *Modular Spectral Closure*, v261): the finite Dirac is a covariance induction of the seam KMS state (v258), the spectral-action cutoff *is* that KMS weight ( $f_2/f_0 = 1$ , v259), the seam, the carrier-16 and  $E_8$  live on one Kummer/K3 surface (v260), so Dirac, cutoff, gauging, glue and orientability are all readouts of the one seam state — the boundary QFT is closed as a single relative object modulo the keystone SEAM.EQUIV.01 and adds *no new open item*, while the ambient quantum-gravity measure is a **[C]** redundancy (v369), not a separate structural gap. [`verification/v234_seam_holomorphy_selection.py`] [`verification/v235_seam_chern_simons.py`]

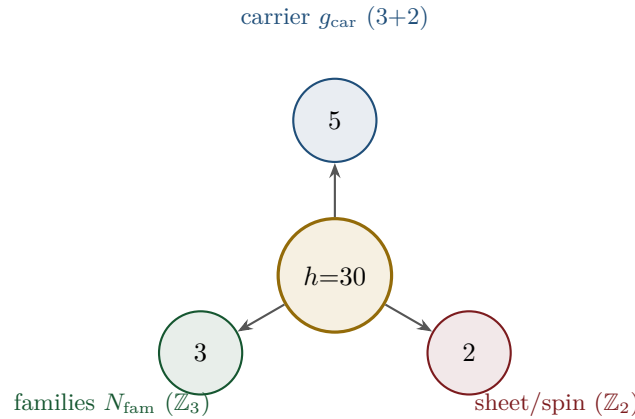

### Reduction in one line

The number of *structural* assumptions is **two axioms**. Everything else ( $N_{\text{fam}}, \Omega_{\text{adm}}, b_1, \alpha^{-1}$ , the flavor matrix, the  $E_8$  glue, the scale grammar) is a *consequence*. And even those two tighten: the bootstrap note shows  $g_{\text{car}} = 5$  and the integer 8 in  $c_3$  are *overdetermined  $E_8$ -closure fixed points* (rank-fill, Coxeter-match, integer-glue/norm all give 5;  $8 = h(D_5) = \text{rank } E_8 = \det R = \varphi(30)$ ), leaving *one* genuine continuous primitive:  $\pi$  from the Möbius boundary. A *fourth, deeper forcing* comes from the McKay correspondence:  $E_8$  is the exceptional top of the tower of finite  $SU(2)$  subgroups, so its branch data is the icosahedron and the three atoms (2, 3, 5) are its rotation-axis orders — the binary icosahedral group  $2I$  (order  $120 = |R^+(E_8)|$ ) has irrep degrees equal to the affine- $E_8$  Kac marks,  $\sum = 30 = h(E_8) = 2 \cdot 3 \cdot 5$  ([[verification/v219\\_icosahedral\\_mckay.py](#)]). So the *discrete* core has no freely tunable fundamental numbers — the bootstrap is *not creation from nothing* (two inputs remain), but an overdetermination of those inputs. (This concerns the discrete core only; dimensionful masses, the QG measure and frontier items remain typed-open.) [[verification/v6\\_bootstrap.py](#)] [[verification/v14\\_carrier\\_uniqueness.py](#)] [[verification/v23\\_anchor\\_generator.py](#)] [[verification/v219\\_icosahedral\\_mckay.py](#)]

## 4 The compiler: why $30 = 2 \cdot 3 \cdot 5$

The Coxeter number of  $E_8$  is  $h = 30 = 2 \cdot 3 \cdot 5$ . Exactly these three prime factors are the three discrete atoms of the theory — that is the point of the compiler:

From this the compiler reads, among others:

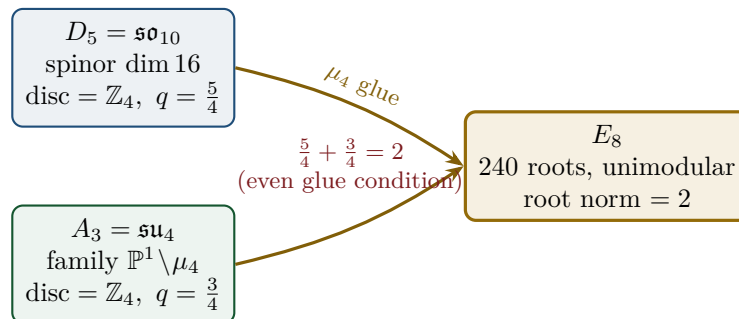

- $\dim S^+ = 1 + 10 + 5 = 16$  (one generation) as the even exterior algebra of the 5-slot carrier — the same Pascal row  $\binom{5}{0}, \binom{5}{1}, \binom{5}{2} = 1, 5, 10$  appears in family, action ladder and the  $E_8$  root count. [E]
- $|R(E_8)| = 16 \cdot 5 \cdot 3 = 240$  and  $\dim E_8 = 240 + (5 + 3) = 248$ . [E]
- the  $\mathbb{Z}_{30}$  Coxeter element  $\leftrightarrow$  the cyclotomic polynomial  $\Phi_{30}$ ; the corner rotation  $z \mapsto iz$  on  $\mathbb{P}^1 \setminus \mu_4$  is the  $A_3$  Coxeter element. [E]
- **why these three primes:**  $E_8$  is the icosahedral top of the McKay tower ( $2I$ , order 120, irrep degrees = affine- $E_8$  marks summing to 30), so 2, 3, 5 are the icosahedron's rotation orders; and the  $E_8$  exponents  $(\mathbb{Z}/30)^\times$  carry an order-4 totative character  $\langle 7 \rangle$  — the same  $\mu_4$  seam clock. [E] [[verification/v219\\_icosahedral\\_mckay.py](#)] [[verification/v223\\_coxeter\\_totative\\_clock.py](#)]
- **a network reading (computational substrate).** On the same McKay (2, 3, 5) graph the affine- $E_8$  marks are the *unique dynamical attractor* of a minimal local-averaging update  $m \leftarrow (A + 2I)/4 \cdot m$  (it converges from *any* positive start to (1, 2, 3, 4, 5, 6, 4, 2, 3)); the spherical tower terminates at  $E_8$  and the cascade  $E_8 \supset E_7 \supset E_6 \dots$  is nested-subgraph coarse-graining. So  $E_8$  reads as the *universal attractor of a minimal* (2, 3, 5) *network* (a Wolfram-style computational-substrate picture) at the Coxeter-skeleton level. [C] A minimal hypergraph *rewrite* reproducing

the *full* structure (lattice + recovery + readouts) stays open, and  $\varphi_0^{\text{ret}}$  is the analytic seed  $\frac{4}{3}c_3 = 1/(6\pi)$ , not an edge fraction. [O] [verification/v298\_e8\_network\_attractor.py]

- **the bridge, hardened.** A local witness-based growth dynamics (a *diffusion-generated* witness + the local balance gate  $Am \leq 2m$ , Collatz–Wielandt = Smith’s  $\rho \leq 2$ ; the Perron eigenvector enters only as an audit) *reaches*  $E_8$  as the last finite point ( $E_6 \rightarrow E_7 \rightarrow E_8$ , then stops at the affine boundary  $\hat{E}_8$ ) — but *only* from a 3-arm  $(2, 3, \cdot)$  seed (the controls  $\rho(A_n) = 2 \cos \frac{\pi}{n+1}$  and  $\rho(D_n) = 2 \cos \frac{\pi}{2n-2}$  are  $< 2$  for *all*  $n$ , so neither family ever reaches  $E_8$ ). So  $P_2$  is exactly the irreducible seed on which the rule reaches  $E_8$  as the last finite point — a second network reading of the  $(2, 3, 5)$  hull, not a derivation of  $P_2$ . [O] [verification/v299\_hypergraph\_0d\_autonomous.py]
- **what a rewrite must inject.** Testing *which* load-bearing quantities are graph-spectral sharpens the open question: [E] the Kac marks are the Perron eigenvector ( $Am=2m$ ) and the subleading eigenvalue is exactly  $2 \cos(\pi/5)$  = the golden ratio (the 5-fold/icosahedral signature), but [E] the recovery rate  $(2/3)^6$  is *not* any eigenvalue of the adjacency and  $\varphi_0^{\text{ret}}$  is not a rational edge fraction. The cusp weight  $2/3 = |\mathbb{Z}_2|/N_{\text{fam}}$  is now *derived* from a minimal branching rule ([verification/v327\_hypergraph\_rewrite.py]); what remains non-graph-spectral for a *full*-structure rewrite at leading order is sharpened by [verification/v396\_phi0\_icosahedral.py] (tree-level  $\varphi_0^{\text{tree}} = F/(4h\pi)$ ); the puncture  $48c_3^4$  alone stays open. [O] [verification/v312\_hypergraph\_substrate.py]
- **one coupled local rule (carrier  $\times$  family).** On a  $9 \times 3$  labelled grid (affine- $E_8$  nodes  $\times$  family channels) a *single* coupled micro-step — network lazy diffusion on each cusp column plus the [verification/v327\_hypergraph\_rewrite.py] branching rule  $M$  on each node’s family vector — has joint attractor marks  $\otimes(w=0)$  and recovery rate  $(2/3)^6$  after one clock hand ( $2N_{\text{fam}}$  family steps); the [verification/v324\_hypergraph\_fiber.py] fiber product  $T_{\text{net}} \otimes T_{\text{cusp}}$  emerges as the cusp-readout basis, and the [verification/v299\_hypergraph\_0d\_autonomous.py] growth trajectory  $E_6 \rightarrow E_7 \rightarrow E_8 \rightarrow \hat{E}_8$  is unchanged with the fiber attached. [E] [verification/v395\_hypergraph\_coupled.py]
- **the seed at leading order.** The tree-level retained seed  $\varphi_0^{\text{tree}} = 1/(6\pi)$  is exactly  $F/(4h\pi)$  on the icosahedral hypergraph ( $F = 20$  triangular hyperedges,  $h = 30$ ,  $|\text{Aut}| = 120$ ): equivalently  $(F/(g_{\text{car}}N_{\text{fam}}))c_3$ , with  $F/h = |\mathbb{Z}_2|/N_{\text{fam}} = 2/3$  the same survival ratio as [verification/v327\_hypergraph\_rewrite.py]; Gauss–Bonnet consistent with  $c_3 = 1/(|\mathbb{Z}_2|4\pi)$ . The puncture  $48c_3^4$  remains analytic, not a graph fraction. [C] [verification/v396\_phi0\_icosahedral.py]

## 5 The $\mu_4$ glue: how $E_8$ is really built

The decisive, now *proved* step:  $D_5$  and  $A_3$  have the *same* discriminant group  $\mathbb{Z}_4$ , and their discriminant-form norms are exactly two TFPT constants which add up to the  $E_8$  root norm.

### Glue theorem (proved)

$\text{disc}(D_5) = \text{disc}(A_3) = \mathbb{Z}_4$ , glue index  $|\mu_4| = 4$ , and  $q(D_5) + q(A_3) = \frac{5}{4} + \frac{3}{4} = 2 =$  the  $E_8$  root norm. Hence  $E_8 = (D_5 \oplus A_3) + \mu_4\text{-glue}$  is a *closed lattice-theoretic* construction — not a blind “positing of 248”. [E] [verification/v1\_e8\_glue.py]

## 6 How derivation now works: the derivation map

What can one concretely *compute* with  $\{c_3, g_{\text{car}}\}$ ? The following map summarises what is now a consequence rather than an assumption.

| Sector                       | How it now arises                                                             | Status  |
|------------------------------|-------------------------------------------------------------------------------|---------|
| gauge group / families       | carrier $3+2$ , $\dim S^+=16$ , $N_{\text{fam}}=3$ , $\Omega_{\text{adm}}=48$ | [E]     |
| hypercharge                  | roots of the charge polynomial $bsY^2 + (s-b)Y - 1$                           | [E]     |
| $U(1)$ index $b_1$           | $b_1 = \frac{g_{\text{car}} 2^{g_{\text{car}}-2} + 1}{10} = \frac{41}{10}$    | [E]     |
| fine structure $\alpha^{-1}$ | unique root of $F_{U(1)}(\alpha) = 0$                                         | [E]     |
| flavor matrix                | transport theorem (H1 proved, H2/H3 force the matrix)                         | [E]/[C] |
| electroweak scale            | $v_{\text{EW}} \sim e^{-\alpha^{-1/5}}$ (carrier divides $\alpha^{-1}$ by 5)  | [E]     |
| cosmological constant        | $\Lambda \sim e^{-2\alpha^{-1}}$ (density quotient; see typing note)          | [E]/[C] |
| Hubble scale                 | $H_0 \sim \sqrt{\Lambda}$                                                     | [C]     |
| inflation amplitude          | $A_s = \frac{N_*^2}{24\pi^2} c_3^7$ in the $R^2$ branch                       | [C]     |
| $E_8$                        | $D_5 \oplus A_3 + \mu_4\text{-glue}$                                          | [E]     |

Marker key: [E] exact / machine-proven · [C] conditional (holds under named hypotheses) · [O] open / axiom · [X] falsifiable kill test. Per-claim fine type in verification/status\_ledger.csv.

**Notable:** the scale grammar is *one* exponential engine. The same number  $\alpha^{-1} \approx 137$  generates the electroweak scale (divided by 5 = carrier), the cosmological constant (times 2) and — via the square root — the Hubble scale. One constant becomes many orders of magnitude.

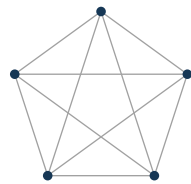

**Typing note on  $\Lambda$  (a deliberate danger zone).** “ $\Lambda$ ” denotes *three* distinct objects that must not be conflated: (i) the seam-determinant exponent  $e^{-2\alpha^{-1}}$  (an exact [E] readout), (ii) the dimensionless density quotient  $\rho_\Lambda/\bar{M}_{\text{Pl}}^4$  (which carries a prefactor *branch*, hence [C]), and (iii) the observed curvature, to which (ii) is *anchored*, not predicted. The exponential is exact; the absolute dark-energy density remains a typed cosmology interface (full disambiguation in `tfpt_2_standard_model`).

### Cosmology is the Pascal action grammar of the carrier

With  $x = v_{\text{geo}}/(5\beta_{\text{rad}}^2\bar{M}_{\text{Pl}})$  the cosmological readouts are a *power tower* on the five-slot carrier graph  $K_5$ :

$$\frac{H_0}{\bar{M}_{\text{Pl}}} = x^5 R_H, \quad \frac{\rho_\Lambda}{\bar{M}_{\text{Pl}}^4} = x^{10} R_\Lambda, \quad (1, 5, 10) = \binom{5}{0}, \binom{5}{1}, \binom{5}{2}$$

EW is the unit  $x^1$ , Hubble is the product over the  $\binom{5}{1} = 5$  vertices,  $\Lambda$  is the product over the  $\binom{5}{2} = 10$  edges — the *same* Pascal triple that reads one generation, the action ladder and the  $E_8$  root count  $16 \cdot 5 \cdot 3 = 240$ . “Hubble = slot product,  $\Lambda$  = pair product.” [E]

$K_5$

- $\binom{5}{1} = 5$  vertices — action  $x^1$  (Hubble slot)
- $\binom{5}{2} = 10$  edges —  $\Lambda$  density pair  $x^{10}$
- $\binom{5}{3} = 10$  triangles — dual sector
- $\binom{5}{4} = 5$  complements — inverse sector
- $\binom{5}{5} = 1$  determinant — closure

$K_5$  on the five carrier slots; the action powers  $x^1, x^5, x^{10}$  are its  $\binom{5}{k}$  faces (mnemonic; the physical scale map stays  $[C]$ ).

### The entire fermion spectrum in one formula

Masses, Yukawa, CKM, PMNS and neutrinos all follow from *one* master formula with *one* seed:

$$\hat{m}_{f,j} = \frac{v_{\text{geo}}}{\sqrt{2}} \lambda_Y^{L_{f,j}} \Lambda_{f,j}, \quad \lambda_Y = \sqrt{\varphi_0^{\text{ret}}(1 - \varphi_0^{\text{ret}})}, \quad \varphi_0^{\text{ret}} = \frac{1}{6\pi} + \frac{3}{256\pi^4}.$$

The word-lengths  $L_{f,j}$  are the *fixed residue matrix of the compiler*, whose characteristic polynomial  $t^3 - 9t^2 + 10t - 8$  carries only compiler numbers ( $\text{tr} = 9 = N_{\text{fam}}^2$ ,  $\det = 8 = h(D_5)$ , principal 2-minors 2,3,5 with product  $30 = h(E_8)$ ). Through the  $\varphi_0^{\text{ret}}$ -ladder  $\hat{m} = \frac{v_{\text{geo}}\pi}{\sqrt{2}} c (\varphi_0^{\text{ret}})^k$  all nine word-lengths are fixed and the *charged-lepton* amplitudes are closed; the *quark mass ratios* are closed too (integer Plücker readouts on the derived selector stratum, **v49/v71**), with only the *absolute* amplitude scale reducing to the single dimensionful anchor  $v_{\text{geo}}$ . **SM status:** the discrete packet, the dimensionless flavor skeleton, the charged-lepton source masses and the quark *ratios* are closed; the *absolute* quark scale and the full PMNS completion are reduced/conditional;  $m_W, m_Z, m_H, \sin^2 \theta_W, \alpha_s$  are RG scheme-layer ( $m_H$  rests on the closed UV quartic  $\frac{1}{16\pi^2}$ ); and the solar angle is *realized* by a *TFPT texture* and reduced to the seam-misalignment lemma ( $\sin^2 \theta_{12} = \frac{1}{3} - \frac{\varphi_0^{\text{ret}}}{2}$ ; see below). (*Full derivation: document 2, **tfpt\_2\_standard\_model**.*) [[verification/v18\\_quark\\_yukawa.py](#)] [[verification/v20\\_lepton\\_c\\_derivation.py](#)] [[verification/v46\\_grand\\_mass\\_volume.py](#)]

## 7 Physical, geometric, topological: why the architecture is plausible

The closure works on three levels at once: *physically*,  $\alpha^{-1}$  is the fixed point of *one* equation and one generator drives many scales; *geometrically*, the  $C^+$  spinor and the puncture geometry  $\mathbb{P}^1 \setminus \mu_4$  produce  $D_5$  and  $A_3$ , glued to  $E_8$ ; *topologically*, the common discriminant  $\mathbb{Z}_4$  (the  $\mu_4$  winding) forces the glue and  $\Phi_{30}$ /Coxeter drives the sectors — with exactly 2 axioms and the rest a consequence. **Why the compiled architecture is plausible.** It is (i) *parsimonious* (few independent assumptions  $\Rightarrow$  low overfitting risk), (ii) *rigid* (the glue condition  $5/4 + 3/4 = 2$  and the discriminant  $\mathbb{Z}_4$  leave little freedom), and (iii) *checkable* (machine-checkable  $E_8$  appendix, explicit fixed-point equation for  $\alpha^{-1}$ ). More explained from less — exactly the criterion that makes a theory more probable.

## 8 What role $E_8$ now plays exactly

$E_8$  is no longer the starting point but the *output format*:

- **Bookkeeping:**  $E_8$  is the unimodular container in which carrier ( $D_5$ ) and family ( $A_3$ ) fit together consistently. Its numbers 240, 248 are carrier traces, not inputs.
- **Consistency test:** unimodularity ( $\det 1$ ) is a hard condition; it closes only because the discriminant-form norms  $5/4$  and  $3/4$  (both already present in TFPT) add up to 2.  $E_8$  thus tests the internal coherence of the two atoms.
- **Not an end in itself:**  $E_8$  does not explain “everything”; it is the smallest even unimodular hull of the datum  $D_5 \oplus A_3$ . The physics sits in the *two inputs*, not in  $E_8$ .

**New — the secondary atlas.** Beyond that,  $E_8$  is an *audit container*: each maximal subalgebra projects a TFPT module. Document 3 (**tfpt\_3\_e8\_audit\_bootstrap**, Part I) shows the seven slices of 248 explicitly and labelled. The strongest new hit is that  $E_6 \times A_2$  reads the flavor matrix:

$$248 = \|R\|_F^2 + \det R + 2(\mathbf{1}^\top R a) N_{\text{fam}} = \underbrace{78}_{\dim E_6} + \underbrace{8}_{\dim A_2} + 2 \cdot 27 \cdot 3,$$

with  $\|R\|_F^2 = 78 = \dim E_6$ ,  $\det R = 8 = \dim A_2 = h(D_5)$ . The discipline rule is: *every load-bearing number must appear in at least one  $E_8$  projection* — this makes the structure falsifiable rather than numerological. (Audit level; all identities machine-verified.)

## 9 What this means for the theory-of-everything question

### The state of the five questions — closed, reduced or typed

1. **Flavor residual — ratios closed; only the absolute scale is the wall-selection.** Mehta–Seshadri supplies the equivalence-class framework (stable parabolic  $\leftrightarrow$  unitary representation); the algebraic selector  $R$ , the  $Q$  spectrum and the splitting type are fixed (now *derived*:  $\det R = 8$  lattice,  $\text{Spec}(Q_+)$  from  $D_4$ , v69/v70; since v136/v139 the dual pair  $(d, n)$  forces  $R$  *columnwise*,  $d$  is pure anchor data, and  $\text{Spec}(Q_+) = (1, 2, 3)$  is the  $A_3$ -exponent grading on the seam curve’s cohomology, v137), and the charged-lepton amplitudes are closed. The quark mass *ratios* ( $c_u/c_d = \frac{55}{117}$  etc.) are then *constant* on this discrete selector stratum (Readout Rigidity, v49/v71) — integer Plücker readouts, no transcendental solve. Only the *absolute* amplitude scale reduces to the selected *polystable* point on the parabolic stability wall ( $U_{\text{point}}$ , an anchor; Research Contract 1). [E]/[O]
2. **Gravity — the local field equation is parameter-free.** The metric-sector *field equation* is supplied by the entanglement first law  $\delta S = \delta \langle K \rangle$  at fixed *volume* (Jacobson 2015): equilibrium forces the *full* covariant Einstein equation  $G_{ab} + \Lambda g_{ab} = c_3^{-1} T_{ab}$  with *both* coefficients fixed —  $8\pi = 1/c_3$  (v358) and  $\Lambda$  from  $\alpha$ ,  $\rho_\Lambda = (3/4\pi^2)e^{-2\alpha^{-1}}$  (v60) — the Einstein tensor (not Ricci) forced by Lovelock, so  $\nabla^a T_{ab} = 0$  is an *output* (v359). The  $R + R^2$  scalaron is the *action*/inflation layer (the next-order term of the same equilibrium route, v360), and  $v_{\text{geo}}$  is the theory’s single dimensionful input (v364). What remains is *not* the field equation but the equation-of-state status (Jacobson framing, not a from-action quantisation; an *external* candidate action — Bianconi’s entropic action, arXiv:2408.14391 — is quantified in v473 without changing this typing) and the one unit  $v_{\text{geo}}$ ; the ambient measure QG.AMB.01 is now a [C] redundancy (v369, conditional on SEAM.EQUIV.01+Bisognano–Wichmann), not missing dynamics, and *perturbative* graviton unitarity is established — the Stelle ghost is a Seeley–DeWitt truncation artefact (v304), the spin-2 sector ghost-free via the entire KMS form factor (v370) with the truncation tower decoupling (v380). [E] (local field equation) / [C] (perturbative unitarity, ambient redundancy)
3. **Strong CP — decoupled.**  $\theta_{\text{eff}} = 0$  follows from three structural facts ( $\gamma_5$ -Hermiticity, polar structure, sheet involution) + reflection positivity — *without* a mass gap. [E] (given RP)
4. **Full dynamics — the admissible transfer model is closed, and the boundary QFT is now one relative object.** The mass gap is the *explicit* discrete gap  $6 \log \frac{3}{2}$  of the  $C_6$  transfer operator (eigenvalues  $(k/3)^6$ ), which supports the OS reconstruction path on the admissible sector. On top of this the whole emergent-QFT round assembles the boundary theory into one relative object  $\text{TFPT}_{\text{QFT}} = (\mathcal{A}_\Sigma, \omega_\Sigma, \Delta_\Sigma, \rho, A_F, H_F, D_F, J, \gamma, S_{\text{rel}})$  — the *Modular Spectral Closure*: the finite Dirac is a covariance induction of the seam KMS state (v258), the spectral-action cutoff *is* that KMS weight (v259), the seam/carrier/ $E_8$  live on one Kummer/K3 (v260), all certified together (v261) — closed modulo the single keystone SEAM.EQUIV.01, whose MMST route SEAM.EQUIV.MMST.01 is *closed modulo cited theorems* (lattice +  $S_3$  stack, Lean FORM.SEAM.MMST.01; v367/v368, v376–v379; the unconditional parent stays [O]). *What this does not fully close*: the full measured pole masses (the absolute scale  $v_{\text{geo}}$  + standard RG), the absolute QCD scales ( $m_p/m_e$ , now a typed [C] transfer, v374), the complete PMNS dynamics (the angles are typed; the full mass/CP dynamics stay [C]/[O]), and the real 4D interacting QFT — the continuum limit, whose cited existence theorems stay [O] — with the ambient measure a [C] redundancy (v369). [E] (transfer model + boundary relative object) / [C] (continuum modulo cited, transfers, ambient redundancy)
5. **Axioms P1/P2 — P2 machine-verified.** The Lean proof builds cleanly (3357 jobs, 0 sorry, only kernel axioms); the P2 algebra is a theorem, P1 a typed interface. They remain declared inputs. [E]/[O]

In other words: the theory has shrunk from “many open audit points” to “*standard steps* (cluster expansion, Fredholm, truncation bound) + two declared axioms”. The five questions are now *closed, reduced or typed* rather than open-ended — a qualitative jump in discipline, not a claim of completion. (*Details and proof chains: document 2, tfpt\_2\_standard\_model, Part III.*)

**The closure ledger: what is done, and what genuinely remains**

A complete theory must close the discrete structure, the dimensionless constants, the mass spectrum, gravity, and the quantum measure. The current state, graded honestly:

| TOE piece                                                                                                        | Status  | If not complete: what closes it                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gauge group, $N_{\text{fam}}$ , hypercharge, $b_1$                                                               | [E]     | — complete                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Marker key: **[E]** exact / machine-proven · **[C]** conditional (holds under named hypotheses) · **[O]** open / axiom · **[X]** falsifiable kill test. Per-claim fine type in *verification/status\_ledger.csv*.

**The honest bottom line:** the discrete core, the dimensionless constants, the *mass-hierarchy exponents* and the mixings are *closed*; the nine masses follow from one  $\varphi_0^{\text{ret}}$ -ladder (lepton rationals exact, quark  $O(1)$  digits still a conditional finite evaluation). The *admissible-sector* QFT measure is closed (a finite gapped transfer system, RP from the cusp spectrum, OS-reconstructed), and on top of it the whole boundary QFT is now *one relative object* TFPT<sub>QFT</sub> (the *Modular Spectral Closure*, v258–v261:  $D_F$  a covariance induction, the cutoff the seam KMS weight, seam/carrier/ $E_8$  on one Kummer/K3) — closed modulo the single keystone SEAM.EQUIV.01. *What that closure does not reach* is exactly the dimensionful/ambient remainder: the full measured pole masses (ladder  $\times v_{\text{geo}}$  + standard RG, **[C]**), the absolute QCD scales ( $m_p/m_e$ , now a typed **[C]** transfer, v374), the complete PMNS dynamics (**[C]**/**[O]**), and the nonperturbative *ambient* measure QG.AMB.01, now itself a **[C]** redundancy (v369). (The metric-sector *field equation* is parameter-free at the local level — the full covariant  $G_{ab} + \Lambda g_{ab} = c_3^{-1} T_{ab}$  from fixed-volume entanglement equilibrium, v358/v359 — and the ambient *measure* is no longer an open structural item but a certification object, conditional on SEAM.EQUIV.01+Bisognano–Wichmann.) The *perturbative* 4D QFT is now built: the spectral-action S-matrix is Epstein–Glaser-constructible and LSZ-bridged to the physical asymptotic S-matrix with one-loop unitarity for the matter+gauge sector (v269–v278), and the spin-2 graviton sector is perturbatively unitary too — the  $R^2/\text{Weyl}^2$  Stelle ghost is a Seeley–DeWitt *truncation artefact* (v304), ghost-free via the entire KMS form factor and the Barnes–Rivers decomposition (v370) with the truncation tower decoupling (v380); the whole bedrock reduces to one geometric postulate, *the raw seam is the flat  $\tau=i$  pillowcase* (v276), with Tier-B’s holomorphy bit  $\det K=1$  (v277) absorbed into SEAM.EQUIV.01. The former single open lemma, the named theorem SEAM.EQUIV.01 — *the raw reflection-positive seam state is the holomorphic  $(E_8)_1$  net at  $\tau=i$*  — is now *closed modulo cited theorems on its MMST route* SEAM.EQUIV.MMST.01 (the twistor route SEAM.EQUIV.TWISTOR.01 and the unconditional parent stay **[O]**). (The flat  $\tau=i$  geometry and the  $E_8$  holomorphy are *two faces of one object*: the  $(E_8)_1$  character is  $\chi_{E_8} = j^{1/3}$ , so  $\chi_{E_8}(i) = 1728^{1/3} = 12$  and  $\tau=i$  is at once the order-4 CM point and the  $(E_8)_1$  partition-function modulus, v282.) The explicit lattice model (v367/v368) and the  $S_3$  stack ( $c=8$ , 248 currents/1 primary, torus GSD=1, RP; v376–v379) pin it at every computable level, and it is Lean-formalised as FORM.SEAM.MMST.01 (collar hypotheses kernel-proved, the MMST scaling-limit and Adamo–Moriwaki–Tanimoto OS-reconstruction theorems as named cited axioms, clean **#print axioms**); the *only* residual that stays **[O]** is the abstract continuum existence of the scaling limit (v336) — its 128-spinor extension leg since re-founded on the peer-reviewed crossed-product package ( $h_s=16/16=1 \in \mathbb{Z}$  is the Longo–Rehren locality criterion; KLM  $\mu=4/2^2=1$ ; AGT/AMT the second witness), the realisation input reduced to invariants (R1’; computed  $|C|=1$ ,  $\nu=16$ ), Lean parallel route **seamResidualClosed’** (v469) — so it is closed *modulo a cited theorem*, not solved, Lean-pinned to exactly those named steps plus the derived Recovery gap  $\Delta = 6 \ln(3/2) \approx 2.43 > 0$  (v308); the conformal-deck premise QGEO.SYM.01 is its *downstream* definitional face (v323). This is by design the *one* irreducible structural input of the theory — the role the *constancy of  $c$*  plays in relativity. It is not a defect to be removed but the single, sharply-localised, falsifiable premise on which the whole boundary closure turns; with the lattice/ $S_3$  pinning and the Lean formalisation in place, “closing the theory” has reduced to invoking exactly the two cited continuum-existence theorems, not an open-ended search. The full sprint-by-sprint reduction that pinned SEAM.EQUIV.01 is recorded in the changelog, not replayed here. The seam seed is *hardened*:  $c_3 = 1/(|\mathbb{Z}_2| \oint_{S^2} K dA) = 1/(8\pi)$  is the one-sided Gauss–Bonnet normalisation of the seam sphere, with the discrete “8” equal to rank  $E_8$  and only the Gauss–Bonnet  $\pi$  left as the single irreducible primitive. What remains for a full TOE is then the cited continuum-existence theorem on the seam and the one unit  $v_{\text{geo}}$ , plus the standard-RG dimensionful masses and the typed frontier transfers (the ambient QG measure being a **[C]** redundancy, v369). No load-bearing discrete parameter remains free, and  $\pi$  is the lone continuous primitive. *4D-QFT fork policy (frozen, v265)*: the canonical 4D reading is *boundary only* — a 4D-GUT is *not claimed by default* ( $E_8$  is the audit hull; SM-only unification is killed, v246); carrier-native Pati–Salam is a separately-typed,

falsifiable UV branch (thresholds + proton decay). Not an open ambiguity, a decision tree.

## 10 TFPT in the light of algorithmic physics: Zuse–Schmidhuber–Wolfram

The “compiler” framing places TFPT in an older lineage — the idea that physics is, at bottom, the output of a short computation — and it is worth stating precisely what TFPT shares with that lineage and where it deliberately parts company, so the family resemblance is not mistaken for a claim the theory does not make. Three landmarks fix the coordinates. **Zuse** (*Rechnender Raum*, 1969) proposed that the universe is literally a (cellular-automaton) computation. **Schmidhuber** sharpened this into an *algorithmic* theory of everything (1997, 2000): the shortest program that outputs a universe is the natural prior — a physics reading of Kolmogorov complexity and Solomonoff induction — while his *Speed Prior* (2002) adds that a computed universe should be one that is *fast* to compute, and his low-complexity-art programme (1997) identifies beauty with compressibility. **Wolfram** (*A New Kind of Science*, 2002; the Physics Project) recasts the same instinct combinatorially: space–time as a hypergraph updated by simple rewrite rules.

### Three shared instincts

1. **Minimal description length as the selection principle.** “No load-bearing free number, only  $\pi$ ” is, in these terms, a Kolmogorov-style compression statement — the plausibility discussion below already names it *Kolmogorov-like compression: many numbers from little* — and the grammar-internal null model of the next section turns it from rhetoric into a measured bound.
2. **Deterministic, resource-bounded generation.** The readouts fall out of a chain of exact identities in about a second, not a search over a model space — the same spirit as the Speed Prior’s preference for *fast*-computable worlds, though TFPT makes no claim to instantiate a speed prior.
3. **Compressibility as the aesthetic.** “Choosing  $E_8$  is choosing the icosahedron” selects the maximally symmetric, shortest-to-describe object; the affine Kac marks  $(1, 2, 3, 4, 5, 6, 4, 2, 3)$  carry a fourfold identity (representation dimensions = network attractor = spectral certificate = local balance weight). This is Schmidhuber’s *beauty = compressibility*, realised on the Standard-Model alphabet rather than on pixels.

### Three deliberate divergences

- (A) **One forced program, not an ensemble.** Schmidhuber’s shortest program computes *all* universes and privileges none; TFPT bets the opposite — an over-determined bootstrap fixed point that *forces* a single dimensionless skeleton ( $g_{\text{car}}=5$  fixed three independent ways). TFPT is a candidate for *the* short program of our constants, not a measure over programs.
- (B) **The description language is algebraic.** TFPT’s compression is measured in a Lie/latitude/VOA language, not in Turing bit-strings; Kolmogorov complexity is language-dependent up to an additive constant, so the honest question — is the shortness real, or hidden in the  $E_8$  machinery? — is exactly what the null model and the “forced three ways” bootstrap are built to answer. A Wolfram-style rewrite reading sharpens the same point rather than dissolving it: the  $(2, 3, 5)$  seed is the terminal of a minimal  $T(2, 3, r)$  growth rule (Cartan determinants  $3, 2, 1, 0, -1$  for  $E_6, E_7, E_8, \hat{E}_8, E_{10}$ ), so the rewrite picture *re-formulates* axiom P2 rather than removing it — both pictures bottom out on the same single irreducible seed.
- (C) **Falsifiability — the one thing TFPT adds.** As *physics*, the Zuse/Schmidhuber algorithmic TOE and Wolfram’s rule search are essentially unfalsifiable: no dated measurement can kill them. TFPT freezes dated, kill-tested predictions (the registry `predictions_frozen.json`,

the predictions section below) and so puts the computational-universe intuition at genuine empirical risk. That, not the compression rhetoric, is the load-bearing difference.

*Status.* This section is *positioning*, not a new result: it introduces no formula and moves no status marker. Its machine-checked hooks already live in the suite — the grammar-internal null-model bound and the icosahedral/McKay bedrock with its network attractor; the Wolfram-style rewrite correspondence is worked out separately in the repository’s hypergraph note. The multiway reading of the arithmetic Hecke tower has meanwhile been *measured out* rather than narrated ([`verification/v747_automaton_multiway_tower.py`], 24/24; [`verification/v748_automaton_sigma_orbifold_confluence.py`], 15/15): confluence is exactly Hecke commutativity (= CRT), the branchial structure is the  $[4, 2]_q$  Grassmann cell count, the  $\sigma$ -quotient is confluent everywhere with only the half-orbit *weighting* breaking at the ramified place — the adjudication is *equivalently useful*, i.e. the Zuse/Wolfram lens falls back exactly onto the known structure and rests as documented exploration.

## 11 Does this make the theory more probable?

**Plausibility balance.** *Pro:* (a) two inputs instead of many; (b)  $\alpha^{-1}$  to  $2.9 \times 10^{-10}$  (CODATA-2022,  $1.9\sigma$ ) as a *fixed point*, not a fit; (c)  $E_8$  constructed, not postulated; (d) one compiler generates several sectors  $\Rightarrow$  fewer degrees of freedom, more predictive power.

*Contra/open:* what remains are only *standard steps* (cluster expansion in the thermodynamic limit, the Fredholm property, the truncation bound) and the two declared axioms P1/P2; on the SM side the dimensionful EW/QCD masses ( $m_W, m_Z, m_H, \sin^2 \theta_W, \alpha_s$ ) sit on the RG scheme layer. The solar angle, previously the one open SM number, is now *conditionally derived* ( $\frac{1}{3} - \frac{\varphi_0^{\text{ret}}}{2}$ , modulo the seam-misalignment lemma). A final verdict “it maps reality” requires this short list plus the near-term experimental tests (below).

Net: the parsimony (Kolmogorov-like compression: many numbers from little) and the high precision of individual closures raise the a-posteriori plausibility substantially — without hiding the open points.

## 12 Predictions for running and upcoming experiments

Because *one* generator now sits behind the numbers, the theory makes a set of concrete, falsifiable statements that running or near-term experiments are actively testing. Each row gives the TFPT value, the *new* derivation behind it, the experiment, and an honest status.

| Observable                          | TFPT value & derivation                                                                                                                                                              | Experiment (running / upcoming)                                                                                                      | St.     |

Marker key: [E] exact / machine-proven · [C] conditional (holds under named hypotheses) · [O] open / axiom · [X] falsifiable kill test. Per-claim fine type in verification/status\_ledger.csv.

### The two decisive near-term tests

- (1) **JUNO** and  $\theta_{12}$ . JUNO is *taking data since August 2025* and targets sub-percent  $\sin^2 \theta_{12}$ . TFPT commits to the single prediction of record  $\frac{1}{3} - \frac{\varphi_0^{\text{ret}}}{2} = 0.306747$  (misalignment  $\varepsilon = \frac{3}{4}\varphi_0^{\text{ret}} = c_3 + 36c_3^4$ ). The first 59.1-day JUNO run reports  $\sin^2 \theta_{12} = 0.3092 \pm 0.0087$  — *compatible*, but the precision phase is still pending; this is a first compatibility check, not yet the decisive test. A converged central value away from  $\sim 0.307$  at high significance falsifies the seam mechanism.
- (2)  $r$ . The  $R^2$  scalaron with  $M$  fixed by  $c_3^7$  predicts a small  $r = 12/N_*^2$ : the frozen band  $r \in [0.0033, 0.0048]$  over  $N_* \in [50, 60]$ , with the scalaron-reheating point  $r = 0.0045$  ( $N_*=51.4$ , v86) — already below the current bound  $r < 0.036$  (BICEP/Keck BK18) and within reach of CMB-S4 ( $\sigma_r \leq 5 \times 10^{-4}$ , first observations  $\sim 2033$ –34). A detection of  $r \gtrsim 0.01$  would be incompatible with the  $R^2$  branch on which  $M_{\text{Pl}}$  and  $A_s$  rest.

**Structural (non-experimental) checks.** Independent of any apparatus, the machine-checkable  $E_8$  appendix (all 240 roots, Gram matrices, discriminant groups) lets anyone verify that the two TFPT atoms really generate  $E_8$ ; and the discipline rule “*every load-bearing number appears in at least one  $E_8$  projection*” (atlas note) turns the number stock into a falsifiable raster rather than

numerology. The numerology charge is additionally *quantified* by an explicit null model: under the declared formula grammar the alignment density is anomalously high — a random theory of equal formula complexity essentially does not reproduce the scorecard. This is a *grammar-internal null-model bound*, not a Bayesian probability that TFPT is true; the explicit figure and its controls are stated in the verification appendix [E] [verification/v100\_numerology\_null\_mc.py].

#### Freeze file: committed kill criteria

To prevent post-hoc rescue, the predictions above are frozen with explicit kill criteria in the machine-readable registry `verification/freeze_file.csv`. The decisive entries:

- **solar**  $\sin^2 \theta_{12} = \frac{1}{3} - \frac{\varphi_0^{\text{ret}}}{2} \approx 0.3067$  — a JUNO central value clearly away from 0.307 kills the seam-misalignment mechanism;
- **tensor**  $r \approx 0.0040$  — any robust  $r \gtrsim 0.01$  kills the  $R^2$  branch carrying  $M_{\text{P1}}, A_s$ ;
- **ordering** normal, small  $m_{\beta\beta}$  — inverted ordering or large  $m_{\beta\beta}$  kills the Majorana branch;
- **strong CP**  $\theta_{\text{eff}} = 0$  — a solid nEDM signal above SM background falsifies the structural cancellation;
- $w = -1$  — a robust  $w \neq -1$  kills the single-engine dark-energy readout.

The proton/electron ratio is explicitly *not* claimed as a compiler power (only fails if mis-asserted as one).

**Blind-prediction registry (frozen 2026-06-09, machine-enforced).** Beyond the kill criteria, the *values* themselves are now frozen: `verification/predictions_frozen.json` registers every dimensionless prediction of record at 25 significant digits *before* JUNO / CMB-S4 / LiteBIRD / DESI decide, and [verification/v84\_frozen\_registry.py] re-derives each decimal from the two axioms on every suite run (formula $\leftrightarrow$ value lock; covered by `manifest.sha256`; ledger `REG.FREEZE.01`). In particular the registry admits exactly *one*  $\theta_{12}$  prediction of record (the seed  $\frac{1}{3} - \frac{\varphi_0^{\text{ret}}}{2} = 0.306747$ ) — the seam and non-linear variants are typed as derived variants of the same texture and can never be silently promoted afterwards.  $r$  and  $n_s$  enter only as *bands* over the declared external  $N_\star \in [50, 60]$ , never as point predictions.

#### What likely follows next.

- the quark mass *ratios* are now closed combinatorially (integer Plücker readouts on the derived selector stratum, `v49/v69/v71`); the only residual is the *absolute* amplitude scale, an anchor ( $U_{\text{point}}$ ) of the same nature as the one dimensionful scale — no new physics;
- further constants as carrier traces (analogous to  $b_1 = 41/10$ ), since the compiler systematically produces traces over  $S^+$ ;
- a sharper geometry $\leftrightarrow$ gravity bridge once the Hodge/ $R^2$  branch is lifted from [C] to [E].

## Conclusion

TFPT's sectors form an impressive collection of closures sharing common numbers. The compiler closure explains *why* they are the same numbers: a small discrete generator  $\mathbb{Z}_{30} = 2 \cdot 3 \cdot 5$  builds, from two inputs  $\{c_3, g_{\text{car}}\}$  via  $D_5 \oplus A_3 + \mu_4$ , the  $E_8$  container and outputs the Standard Model, the constants and the scale grammar from there. The theory thereby becomes *more parsimonious, more rigid and more checkable*. Precisely nameable gaps remain — one geometric flavor realisation, the conditional gravity/QFT closures, and two declared axioms — but the path to closure is now short and concrete.

## Appendix: computational verification (reproducibility)

Every claim in this document marked [E] (exact identity), [E] (Lie/lattice theorem) or [E] (numerical fixed point) is re-derived from the two axioms  $\{c_3, g_{\text{car}}\}$  alone by a small, self-contained Python suite in the repository folder `verification/`. The inline references [verification/...] throughout the documents point to the exact script; the table below is the master map (its source is the shared fragment `tex-artefacts/verification.tex`).

| Script                             | What it machine-checks                                                                                                                                                                                                                   |

| v139_selector_triangle.py | Selector triangle: $d=\frac{3}{2}a-2\cdot\mathbf{1}$ exactly (pure anchor data, no $R$ ) $\Rightarrow$ the first selector is <i>derived</i> ; the frame $(\mathbf{1}, a, \sigma)$ has $\det=11=\ \text{Pl}(K)\ _1$ , and $n$ is the <i>unique</i> covector with atom pairings $(2, 8, 121)=( \mathbb{Z}_2 , \text{rank } E_8, 11^2)$ ; on the constrained line the pairing is $11(11+t)$ , a square only at the true $n$ ; review lift exact (audit): $n=\text{reverse}(\sigma)+ \mu_4 e_3$ ; $R_4'$ residue = three pairings $[\mathbf{E}]/[\mathbf{C}]$ ( <i>since v142: two — the third pairing is integrality-forced</i> ) |
| v140_canonical_map.py     | The canonical map exists and is rigid: the plain deck $U$ (characters $(0, 1, 3)$ ) cannot match $H^1$ ; the <i>sheet-twisted</i> $-U$ $((2, 3, 1))$ and the cusp exponential $i^{Q+}((1, 2, 3))$ both carry the $H^1$ character set $\{1, 2, 3\}$ (the v118 sign twist); multiplicity-freeness $\Rightarrow$ Schur-rigid equivariant isomorphism (unique up to scalars); $i^{Q+}$ pulls the Euler degree back to $Q_+$ , $-U$ to $Q_+\circ\rho$ — the QGEO residue collapses to <i>one</i> $\mathbb{Z}_3$ choice $[\mathbf{E}]/[\mathbf{C}]$ ( <i>the choice since derived, v141</i> )                                        |
| v141_deck_selection.py    | Deck Selection Theorem (R5): the established integer deck $G=T_A\Sigma$ (v97/v98) pairs the $Q_+=1$ line with the self-conjugate character 2 $\Rightarrow$ of the three $\mathbb{Z}_3$ rotations only the sheet-twisted $(2, 3, 1) = \text{chars}(-U)$ survives; $i^{Q+}$ excluded (same spectrum, wrong grading pairing); residual freedom = the established sheet $\mathbb{Z}_2$ (v92); Euler degree = $Q_+\circ\rho$ $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                                                            |
| v142_frame_integrality.py | Frame Integrality (R4'): pairing triples of <i>integer</i> covectors against $(\mathbf{1}, a, \sigma)$ form an index-11 sublattice $(x-3y+z \equiv 0 \pmod{11}, 11=\ \text{Pl}(K)\ _1)$ ; with $(x, y)=( \mathbb{Z}_2 , \text{rank } E_8)$ the third pairing is forced $\equiv 0 \pmod{11}$ , primitivity forces even $t$ ; Cramer reductions for the two line pairings; $R_4'$ : three pairings $\rightarrow$ two $[\mathbf{E}]/[\mathbf{O}]$ ( <i>since v145: the values are atom identities — residue = one lift map</i> )                                                                                                  |
| v143_graded_frobenius.py  | Graded Frobenius (R2 at the finite Lie level): coset duality $-C_k=C_{-k}$ exact on all 240 roots $\Rightarrow$ Killing pairing nondegenerate per $g_k \times g_{-k}$ ; glue average = carrier projector (index $ \mathbb{Z}_4 =4$ ); each sector one $W(D_5)\times W(A_3)$ orbit = simple current; fusion = $\mathbb{C}[\mathbb{Z}_4]$ (v125); residual = the one conformal-net statement $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                                                                                         |
| v144_detratio_family.py   | Det-ratio cancellation within the SdS family (R1, the v131 step): $e_2$ -rigidity gives $r_b r_c = 1 - \Delta^2/3$ exactly $\Rightarrow$ $\det'$ -ratio = $(1 - \Delta^2/3)^{4/3}$ (via $\zeta(0) = -\frac{2}{3}$ , v132) — no first-order term in the split; deficit coefficient $\frac{32}{27} =  \mu_4 (\frac{2}{3})^3$ (audit); finite-weight absorption stays open with the $6 \rightarrow \frac{14}{3}$ obstruction stated sharply $[\mathbf{E}]/[\mathbf{C}]$ ( <i>the bend since shown <math>\det'</math>-clean, v147</i> )                                                                                            |
| v145_pairing_atoms.py     | $R_4'$ values are <i>atom identities</i> : with the lift $n=w_0(\sigma)+ \mu_4 e_3$ ( $w_0$ = the $A_3$ exponent duality), $n\cdot\mathbf{1}= \mu_4 - \mathbb{Z}_2 = \mathbb{Z}_2 $ , $n\cdot a= \mu_4 a_3=8$ via the new closure $ \mu_4 +g_{\text{car}}=N_{\text{fam}}^2$ ( $4+5=9$ , $\sigma \perp w_0(a)$ ), $n\cdot\sigma=\ \sigma\ ^2-N_{\text{fam}}^2+ \mu_4 g_{\text{car}}=121$ ; residue = derive the <i>one</i> lift map $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                                                 |
| v146_moebius_d4.py        | Möbius $D_4$ realisation (R5 at its floor): the full dihedral $\langle z \mapsto iz, z \mapsto 1/z \rangle$ on $H^1(\mathbb{P}^1 \setminus \mu_4)$ matches the integer model $\langle G, T_A, \Sigma \rangle$ exactly — $\iota^*$ swaps $\chi_1 \leftrightarrow \chi_3$ , fixes $\chi_2$ with $+1$ , $\det=-1$ ( $=T_A$ in the cusp basis); $\delta\iota=\Sigma$ class; parities match (v98) — the GATE.QGEO premise reduces to the module identification $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                          |
| v147_clock_gaussian.py    | The clock is a Gaussian zero-mode integral (R1): variance ratio $(1-\alpha)$ (norm = area, v131) $\Rightarrow$ Born <sup>2</sup> $\Gamma$ -ratio $(1-\alpha)^{p_2}$ , rate = $-p_2 \ln(1-\alpha)$ = the v127 ring sum term by term; the bend $\log_{3/2} 3$ lives between the two Nariai levels of <i>one</i> geometry $\Rightarrow$ $\det'$ -clean; the $6 \rightarrow \frac{14}{3}$ obstruction is localised to the $\alpha=0$ reference $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                                         |
| v148_fock_census.py       | NS/R sector census (R2 scoped, corrected): the untwisted (NS) module of the 16 Majoranas carries only the <i>even</i> classes $\{0, 2\} \times \{0, 2\}$ — the odd glue sectors $k(1, 1)$ are <i>Ramond</i> modules; the R zero-mode module ( $2^8=256$ ) splits $128+128$ into the odd sectors of the <i>two</i> Lagrangian glues (v92): choosing the glue <i>is</i> choosing the R-projection ( $128$ = one $SO(16)$ chirality), $248=120_{\text{NS}}+128_{\text{R}}$ ; R2 is irreducibly a twisted-sector net statement $[\mathbf{E}]/[\mathbf{C}]$                                                                         |
| v149_cusp_normal.py       | Both dual normals are <i>anchor data</i> ( $R_4'$ ): in the cusp frame $n$ pairs to $(6, 3, 5) = (p_2, p_0, e_2)(a)$ — one anchor invariant per $Q_+$ line ( $d = \frac{3}{2}a - 2\cdot\mathbf{1}$ in the generation frame, v139); equivalent to the $(2, 8, 121)$ frame data and the $w_0$ -lift (v145); audit: $\sigma \rightarrow (5, 1, 2)$ , sum 14 = $\dim G_2$ ; residue = <i>one</i> assignment $[\mathbf{E}]/[\mathbf{C}]$                                                                                                                                                                                            |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v150_replica_eh_model.py       | The EH form from the replica variation, at the gapped-model level (first R3 movement): conical deficit exact and $t$ -independent (image sum $(N^2-1)/(12N) = C(2\pi/N)$ ); the gap makes the $\zeta$ -variation <i>finite and cutoff-independent</i> , $\Delta \log \det' = 2C(\gamma) \ln m$ ; linearisation $= (\ln m/12\pi) \int \sqrt{g} R$ — the EH form; target equation $k=c_3/2 \Leftrightarrow \ln m = \frac{3}{4} = q(A_3)$ (audit); Calderón transfer + normalisation stay open — SEAM.THEOREM.01 narrows, does <i>not</i> close [E]/[O] ( <i>Calderón transfer since answered — the DtN kernel is conically clean, v151</i> ) |
| v151_bfk_split.py              | BFK split (the Calderón transfer of v150 answered): the Kac corner constant is boundary-condition <i>independent</i> ( $C_N=C_D$ , derived from reflection doubling) $\Rightarrow$ the conical deficit of the Calderón/DtN jump determinant <i>vanishes identically</i> , $C_{\text{DtN}}=C_{\text{cone}}(\gamma)-2C_D(\gamma/2)=0$ ; via Burghelea–Friedlander–Kappeler the seam-reduced action inherits the v150 EH form verbatim — the EH content sits in the <i>local</i> half determinants, the nonlocal kernel is conically clean; residue = the $q(A_3)$ normalisation + the kernel premise [E]/[O]                                 |
| v152_norm_is_anchor.py         | R3's normalisation <i>is</i> the dimensionful anchor: the EH coefficient is $k = \ln(m/\mu)/(12\pi)$ — $\ln m$ alone is scale-ambiguous, only the ratio $m/\mu$ is physical; $k=c_3/2 \Leftrightarrow m/\mu=e^{3/4}$ is the induced-gravity anchor $1/G$ (v68), <i>not</i> a separate gap; the irreducibles stay {one scale, $\pi$ }; audit: the log-ratio $= \frac{3}{4} = q(A_3)$ is the target value, NOT a derivation [E]/[O]                                                                                                                                                                                                          |
| v153_no_unit_theorem.py        | No-Unit Theorem (v78/v152 formalised): dimensionless data are scale-invariant under $L \mapsto \lambda L$ , a mass / $1/G$ is not, so a dimensionless compiler <i>cannot</i> select an absolute scale; the three residuals collapse — $U_{\text{point}} \sim v_{\text{geo}}$ , $1/G \sim v_{\text{geo}}^2$ , $m/\mu = e^{3/4}$ (a ratio); $v_{\text{geo}}$ is an irreducible metrology primitive, not an open gap; irreducibles stay {one unit, $\pi$ } [E]/[O]                                                                                                                                                                            |
| v154_simple_current_theorem.py | Simple-Current Extension Theorem (the central $G_{\text{net}}$ theorem, assembled): $A=(D_5)_1 \otimes (A_3)_1$ extended by the isotropic glue $L=\langle(1,1)\rangle$ has index $ L =4$ , $c=5+3=8$ , $\mu(B)=\mu(A)/ L ^2=16/16=1 \Rightarrow$ holomorphic $\Rightarrow B=(E_8)_1$ (unique even-unimodular rank-8; $SO(16)_1$ excluded); finite realisation in hand (v125/v128/v143/v148); residue = the seam-side identification [E]/[C]                                                                                                                                                                                                |
| v155_quasifree_boundary.py     | Quasi-free in $\Rightarrow$ quasi-free out (Python-only): the boundary marginal of a Gaussian bulk is the compression $PTP$ (a contraction, hence a valid covariance), so the $G_{\text{net}}$ analytic premise (v110(b)/v113) <i>follows</i> from ‘the seam bulk is a reflection-positive free field’ — the <i>same</i> premise as v59 (area law) and v150/v151 (EH); the seam-side identification reduces to ONE shared physical premise [E]/[O]                                                                                                                                                                                         |
| v156_seam_net_construction.py  | Constructive route (Route 3) to its exact endpoint: the DtN/Calderón operator of the 2d Laplacian is $\omega_k= k $ (free chiral dispersion); 16 free Majoranas give $c=8=5+3$ ; the $E_8$ currents are $248=120_{\text{NS}}+128_{\text{R}}$ ; and the $(E_8)_1$ character $E_4/\eta^8 = q^{-1/3}(1+248q+4124q^2+\dots) = j^{1/3}$ (verified to order 4) makes $B \cong (E_8)_1$ a <i>checked</i> identity, not an assertion; residual = the free-bulk premise (v155) + net existence [E]/[C]                                                                                                                                              |
| v157_rigid_fixed_point.py      | Freeness as a <i>rigid fixed point</i> (simplicity-first reframing of premise A): (i) the DtN/Calderón symbol is universally $ k $ (Lee–Uhlmann, bulk-detail-independent — the free dispersion is not a premise); (ii) a holomorphic $c=8$ theory has <i>no</i> marginal $(1,1)$ field (all $\bar{h}=0$ ) $\Rightarrow$ rigid, isolated, no room for an interaction; (iii) the same $ \mathbb{Z}_2 $ that halves $8\pi$ in $c_3$ IS the Ramond projection giving $\mu=1$ ; (iv) holomorphic $c=8$ unique $= (E_8)_1 =$ free. Premise (A) shrinks from ‘prove Gaussianity’ to ‘the gapped flow reaches the holomorphic fixed point’ [E]/[C] |
| v158_fixed_point_stable.py     | The free chiral $c=8$ fixed point is <i>stable</i> (exact dimension count, the finite core of (A)): Majorana $h=\frac{1}{2}$ , bilinear current $h=1$ , quartic $h=2$ ; the relevant window $(0,1)$ for bosonic operators is <i>empty</i> , the $h=1$ currents are chiral (not $(1,1)$ -marginal, v157), the lowest interaction (quartic) is $h=2>1$ irrelevant $\Rightarrow$ isolated stable fixed point; (A) reduces to a basin-of-attraction statement [E]/[C]                                                                                                                                                                          |

*continued on next page*

| Script                                | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v159_pyrate_gauge_crosscheck.py       | PyR@TE cross-check of the $F_{\text{transfer}}$ gauge inputs: the carrier/SM content gives $(b_1, b_2, b_3) = (\frac{41}{10}, -\frac{19}{6}, -7)$ by the textbook one-loop formula; $b_1 = \frac{41}{10}$ holds <i>three</i> independent ways — carrier algebra $10b_1 = g_{\text{car}} 2^{g_{\text{car}}-2} + 1 = 41$ , the $U(1)$ hypercharge index $\sum \frac{3}{5} Y^2$ , and the external RGE generator PyR@TE3 ( <a href="#">arXiv:2007.12700</a> ) which writes $\beta_{g_1} = (\frac{41}{10}) g_1^3$ verbatim; the $M=41$ split $10b_1 = 40_{(\text{ferm})} + 1_{(\text{Higgs})}$ reproduces v13 Gate 1; evidence in <a href="#">verification/pyrate</a> . The transfer functor's gauge inputs are not free knobs <a href="#">[E]</a> / <a href="#">[C]</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v160_seam_gaussianity_from_pf.py      | Seam Gaussianity as a <i>conditional</i> fixed-point theorem (the proposed closure of premise A, honestly typed): (1) quasi-free $\Rightarrow$ all higher connected cumulants $\kappa_{2n}=0$ (signed set-partition/Pfaffian inversion, exact on a pure Majorana covariance); (2) Wick functoriality $\Rightarrow$ a kernel-preserving transport fixes the whole quasi-free state (v113); (3) the Perron–Frobenius dichotomy (a <i>fixed</i> $\kappa_{2n}$ is a SECOND fixed ray, breaking uniqueness; a <i>non-fixed</i> one decays by the gap) forces Gaussianity; (4) the qualitative claim needs only $\text{gap} > 0$ — the value $(2/3)^6$ only sets the rate. <b>The load <a href="#">[O]</a>:</b> v56's gapped PF uniqueness lives on the 3-dim scalar transfer spectrum $\{1, (2/3)^6, (1/3)^6\}$ , while the seam correlation cone has $\binom{16}{4}=1820$ , $\binom{16}{6}=8008$ cumulant directions $\Rightarrow$ (A) reduces to the single internal statement ‘the admissible TFPT transport is primitive + spectrally gapped on the <i>full</i> Schwinger cone, not only the readout spectrum’ <a href="#">[E]</a> / <a href="#">[O]</a>                                                                                                                                                                                                                                                   |
| v161_one_particle_reduction.py        | The cone reduces to one particle (discharging v160's scope premise via Bogoliubov second quantisation): a quasi-free transport is $T=\Gamma(t)$ , the second quantisation of a one-particle contraction $t$ ; $\Gamma(t)$ acts on the degree- $m$ correlator sector as the exterior power $\Lambda^m(t)$ , so (1) $\text{spec}(\Gamma(t) _{\deg m}) = \text{products of } m \text{ one-particle eigenvalues}$ <a href="#">[E]</a> ; (2) <b>the cone gap equals the one-particle gap</b> — the sub-leading eigenvalue over the whole cone is $(2/3)^6$ exactly <a href="#">[E]</a> ; (3) the eigenvalue-1 sector = wedges of the fixed subspace (disconnected Wick powers), no independent fixed higher cumulant, uniqueness closed by v113 (one polarization $\Leftrightarrow$ one state) <a href="#">[E]</a> ; (4) quasi-freeness <i>forced</i> not assumed — the $120 = \dim \mathfrak{so}(16)$ chiral currents are the Bogoliubov generators and v158 makes every non-Gaussian deformation irrelevant <a href="#">[C]</a> . <b>Residual <a href="#">[O]</a>:</b> v160's three full-cone premises collapse to ONE 16-dim one-particle statement (seam symbol = gapped Calderón Bogoliubov map, fixed = rank-8 $K_\Sigma$ , gap $(2/3)^6$ ); all numbers supplied, only the physical identification (Kawahigashi–Longo class = the A2 net residual) stays open <a href="#">[E]</a> / <a href="#">[O]</a> |
| v162_seam_transport_identification.py | The final identification, forced as far as it goes — the v161 one-particle statement carries <i>no</i> new open content: (1) the gap $(2/3)^6$ is <i>forced</i> — cusp weights $= \text{spec}(A_0^*) = \{0, \frac{1}{3}, \frac{2}{3}\}$ (parabolic residue, v115), transfer eigenvalue $(1-\alpha)^{p_2}$ , $p_2=6= R_+(A_3) $ , all carrier data <a href="#">[E]</a> ; (2) $\mu_4$ -equivariance forces the generator diagonal in the cusp basis — $\sum_k U^k X U^{-k} =  \mu_4  \text{diag}(X)$ , commutant of $U =$ the diagonal algebra — so the gapped $\mu_4$ -equivariant generator has spectrum = the cusp weights, gap $(2/3)^6$ <a href="#">[E]</a> ; (3) the cusp grading <i>is</i> the $A_3$ grading on the 16 Majoranas (v137) <a href="#">[E]</a> ; (4) the fixed space = the rank-8 Calderón polarization (v113/v156) <a href="#">[E]</a> . <b>Closure <a href="#">[C]</a>/<a href="#">[O]</a>:</b> with v160+v161, (A) closes given only $\mu_4$ -equivariance + admissibility, whose two non-derived inputs are the <i>already-open</i> A2 (net existence) and R1 (seam clock, <a href="#">HOR.CLOCK</a> ) — so (A) factors exactly into A2 + R1, adds <i>no</i> new open item, and is closed conditionally on them (a unification, not an unconditional proof) <a href="#">[E]</a> / <a href="#">[O]</a>                                                                               |
| v163_rg_stability_flavor.py           | $F_{\text{transfer}}$ scale-tagging: the lepton-mixing seeds ( $\sin^2 \theta_{12} = \frac{1}{3} - \frac{\varphi_0}{2} = 0.3067$ , $\sin^2 \theta_{13} = \varphi_0 e^{-5/6} = 0.0231$ ) are <i>RG-stable</i> — PMNS running is $y_\tau^2$ -suppressed ( $\sim 1.8 \times 10^{-5} \ll \text{precision}$ ), so seam value = measured value; the quark mass-ratio readouts ( $m_t/m_b \sim 41$ ) run through $y_t^2 \sim O(10\text{--}15\%)$ and carry a scale tag. The only mixing-rotating Yukawa term $\frac{3}{2} Y Y^\dagger Y$ carries $y_{\text{max}}^2$ (PyR@TE SM RGEs) <a href="#">[E]</a> / <a href="#">[C]</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v164_qcd_scale.py                | the QCD confinement scale is parameter-free from the carrier $b_3=-7$ : running $\alpha_s(M_Z)$ down (two-loop, $n_f$ thresholds) gives $\alpha_s(m_b)\sim 0.22$ , $\alpha_s(m_c)\sim 0.38$ and confinement ( $\alpha_s\sim 1$ ) at $\sim 0.5$ GeV — so the QCD-scale <i>numerator</i> of $m_p/m_e$ is independently sourced (dimensional transmutation), while the ratio 1836 stays the honest ‘Open / not forced’ frontier non-claim ( $m_p=O(1)\Lambda$ is lattice) [E]/[O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| v165_premise_a_closure.py        | Premise (A), the honest maximal closure — the two residual gates pinned to their floor, so (A) carries <i>zero</i> independent open content: (1) A2 (net existence) closes by <i>assembly</i> of established mathematics [C] — 16 free Majoranas give a free-fermion net (Buchholz–Mack–Todorov / Böckenhauer–Evans), the holomorphic $c=8$ lattice net is $(E_8)_1$ (Frenkel–Kac–Segal / Dong–Xu / Kawahigashi–Longo), the $\mu_4$ extension is a Longo Q-system of index 4 (v125), $\mu(B)=16/16=1$ , $248=120+128$ , character $E_4/\eta^8=j^{1/3}$ (v156); the only TFPT input (seam Calderón kernel = free-fermion two-point function) is done via DtN = $ k $ (v156/v157); (2) R1 (seam clock) reduces to GATE.QGEO [C] — $\mu_4$ -equivariance forces diagonal-in-cusp, the flat $\mu_4$ -equivariant generator is <i>unique</i> = $A_0^*$ (v115/v116) so the gap $(2/3)^6$ is forced, residual = ‘seam boundary = the $\mu_4$ -punctured sphere $\mathbb{P}^1\setminus\mu_4$ ’ = GATE.QGEO (cohomology established, v137); (3) the irreducible core stays $\{\pi, v_{\text{geo}}\}$ , a <i>theorem</i> by the No-Unit Theorem (v153). <b>Final accounting:</b> (A) = A2 assembly [C] + R1=GATE.QGEO + the $\{\pi, v_{\text{geo}}\}$ core $\Rightarrow$ ZERO independent open gates; a unification + re-typing, not an unconditional proof [E]/[O] |
| v166_higgs_free_seam.py          | the Higgs quartic from the <i>free seam</i> (premise A / v158): a Gaussian seam UV forces $\lambda(M_{\text{seam}})=0$ and $\beta_\lambda(M_{\text{seam}})=0$ (Shaposhnikov–Wetterich double criticality, here <i>motivated</i> not assumed). Two-loop PyR@TE-sourced SM running with the measured $(m_H, m_t)$ gives $\lambda(\bar{M}_{\text{Pl}})\sim 0.002$ , $\beta_\lambda(\bar{M}_{\text{Pl}})\sim 0$ — the famous SM near-criticality, now <i>explained</i> by the free seam (2-loop sharpens $\lambda(\bar{M}_{\text{Pl}})$ from $\sim 0.022$ to $\sim 0.002$ ). The double condition predicts $m_H\sim 129\text{--}134$ GeV; at the scalaron scale it gives $\sim 107$ GeV (too low) $\Rightarrow$ the BC lives at $\bar{M}_{\text{Pl}}$ (seam=Planck) [E]/[C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| v167_inventory_post_closure.py   | The terminal residual inventory (post premise-(A) closure; line v105 $\rightarrow$ v123 $\rightarrow$ v167): after the (A)-chain (v160–v165), premise (A) is <i>no longer</i> an independent structural class (GATE.METRIC.16–19). The residual collapses from v123’s FIVE classes to: <b>Tier 0</b> — the irreducible core $\{\pi, v_{\text{geo}}\}$ , a <i>theorem</i> (No-Unit, v153), nothing to close; <b>Tier 1</b> — ONE hinge (seam = flavour = horizon): $A_2$ net existence (assembly of established net constructions) + GATE.QGEO (seam boundary = $\mathbb{P}\setminus\mu_4$ , cohomology $b_1=N_{\text{fam}}=3$ ); <b>Tier 2</b> — folded ( $\rightarrow v_{\text{geo}}$ , $\rightarrow G_{\text{net}}$ ); <b>Tier 3</b> — $F_{\text{transfer}}$ , one functor with four typed conditional interfaces ( $\eta_B$ carries the most open room). Completeness: a sixth independent structural class fails the script — a unification + re-typing, not an unconditional proof [E]/[C]                                                                                                                                                                                                                                                                                                                                                           |
| v168_qgeo_rigidity.py            | The QGEO <i>Rigidity Theorem</i> — the finite half of the Tier-1 hinge GATE.QGEO, hardened. | Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v176_seam_collar_realisation.py | The Seam Collar Realisation Theorem assembled as ONE central statement + reduction certificate (the single structural proof obligation, formulated cleanly — <i>not</i> a fabricated proof): given an oriented one-sided RP seam collar with a sheet-odd Calderón involution, faithful $D_4$ marks and admissible $c=8$ data, <i>then</i> its conformal boundary is Möbius-equivalent to $\mathbb{P} \setminus \mu_4$ with $H^1$ grading $(1, 2, 3)$ , the Calderón contraction is the rank-8 $K_\Sigma$ polarisation and the index-4 extension is $(E_8)_1$ . The proof decomposes into six steps, FIVE already [E]: geometry/uniformisation (v168: cross-ratio 2, faithful Möbius $D_4$ order 8, $b_1=N_{\text{fam}}=3$ ), Calderón DtN symbol $ k $ (v156), $H^1$ character = generation grading $(1, 2, 3)=A_3$ exponents=Spec( $Q_+$ ) (v137/v168), $\mu_4$ -equivariant contraction diagonal with gap $(2/3)^6$ (v162), AQFT closure $(D_5)_1 \otimes (A_3)_1 \rtimes \mu_4 = (E_8)_1$ + full-cone RP all $m$ (v154/v175); the whole structural residual reduces to the ONE open premise QGEO.REALIZE.01 (the physical seam collar's boundary <i>is</i> this $\mathbb{P} \setminus \mu_4$ ), left honestly [O][E][O]                                                                                                                                                                                           |
| v177_seam_marking_kernel.py     | The QGEO proof tree — the v176 single realisation premise split into its honest constituents: REALIZE = MARKS · UNIFORM · COHOM · MODULE · KERNEL · NET, with FOUR nodes closed <i>constructively</i> [E] and the open residual sharpened into exactly TWO named obligations. [E] UNIFORM (Lemma 2, constructive): an order-4 Möbius map conjugates to $z \mapsto iz$ , a non-fixed orbit scales to $\mu_4$ , the reflection $z \mapsto 1/z$ gives $\sigma\rho\sigma = \rho^{-1}$ ( $D_4$ , order 8) — a genus-0 four-marked faithful- $D_4$ boundary <i>is</i> $(\mathbb{P}, \mu_4)$ ; [E] COHOM: $\rho^*\omega_k = i^k\omega_k$ so the $H^1$ grading is $(1, 2, 3)=A_3$ exponents=Spec( $Q_+$ ); [E] MODULE: the $H^1 \rightarrow$ generation iso is <i>unique</i> (multiplicity-free + residue normalisation; reflection $\omega_1 \leftrightarrow \omega_3$ , $\omega_2$ fixed); [E] NET (v154/v175): index-4 $\mu_4$ extension of $(D_5)_1 \otimes (A_3)_1 = (E_8)_1$ . The TWO genuine open obligations [O]: QGEO.MARKS.01 (raw seam $\rightarrow$ genus-0 four-marked $D_4$ boundary) and QGEO.KERNEL.01 (raw seam Calderón kernel = the $\mu_4$ -equivariant free gapped contraction as an <i>operator</i> ); the whole structural residual is now exactly these two doors [E][O]                                                                                                                            |
| v178_marks_kernel_attempt.py    | An honest <i>attempt</i> at the two open obligations QGEO.MARKS.01 + QGEO.KERNEL.01 — <i>not</i> a closure (genuine constructive-geometry/AQFT statements, not finite computations), but a deeper reduction: each finite core is closed [E] and each obligation reduced to ONE sharper irreducible premise [O]. <i>Marks core</i> [E]: a genus-0 double with an order-4 clock $\rho$ ( $\sim z \mapsto iz$ , fixed points $\{0, \infty\}$ ) and reflection $\tau$ forces the marks to be a generic $\rho$ -orbit $\{1, i, -1, -i\} = \mu_4$ (not the fixed points), distinct iff $b_1=4-1=3=N_{\text{fam}}$ , $\tau\rho\tau=\rho^{-1} \Rightarrow$ faithful $D_4$ order 8 — so MARKS reduces to the single topological/clock premise. <i>Kernel core</i> [E]: on the 3-dim multiplicity-free $H^1$ the $\mu_4$ characters $(1, 2, 3)$ are distinct, so by Schur a $\mu_4$ -equivariant operator is forced diagonal and <i>completely determined by its eigenvalue per character</i> — two such with the forced transfer spectrum $\{1, (2/3)^6, (1/3)^6\}$ (v162) and the unique residue-normalised basis (v177) are <i>equal as operators</i> , not merely isospectral (the spectrum-vs-operator worry vanishes on the finite block); so KERNEL reduces to the single full-operator-reduction premise (principal symbol $ k $ , Lee–Uhlmann/v156; no drift, v158). Neither obligation closed; both sharpened [E][O] |

|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v179_conformal_realisation.py       | The two residual premises (MARKS-residual + KERNEL-residual) collapse to ONE geometric premise QGEO.CONF.01 (honest unification; the conformal realisation stays [O]). MARKS's residual is not three independent assumptions: (1) genus-0 <i>is</i> P1 — $c_3=1/( \mathbb{Z}_2  2\pi \chi(S^2))=1/(8\pi)$ with $\chi=2 \Rightarrow g=0$ , the same $\chi=2$ that gives the '8' (v58/v73); (2) the order-4 clock <i>is</i> the carrier — Coxeter element of $W(A_3)=S_4$ , order $h(A_3)=4= \mu_4 $ (v117); (3) marks = one orbit is <i>forced</i> — parabolic marks $\neq$ the two elliptic fixed points $\{0, \infty\}$ , a free order-4 orbit has exactly $4=e_1(a)$ points. So MARKS reduces to 'the carrier clock acts conformally on the genus-0 double'. KERNEL then follows from that geometry: DtN symbol $ k $ (Lee–Uhlmann, v156) $\Rightarrow$ rank-8 $c=8$ fixed polarisation; no drift (v158); the cusped-surface residual data is $H^1=\mathbb{C}^3=N_{\text{fam}}$ , the 3-dim gapped transfer block (Schur, v162/v178). Both $\Rightarrow$ ONE premise QGEO.CONF.01: the raw RP seam double is conformally $(\mathbb{P}, \mu_4)$ with the carrier clock as the order-4 Möbius map — the single structural residual of the whole theory, left honestly [O][E][O]                                                         |
| v180_clock_is_mobius.py             | Cracking QGEO.CONF.01 one level further — the conformal-realisation premise is <i>replaced</i> , via three classical theorems, by a strictly <i>milder</i> , non-circular premise QGEO.ISO.01: 'the carrier clock is an order-4 orientation-preserving <i>isometry</i> of the RP seam metric'. (1) Uniformisation (Poincaré–Koebe): a genus-0 Riemann surface is conformally $\mathbb{P}$ , so the genus-0 seam double (P1, v179) <i>is</i> $\mathbb{P}$ — the target is produced, not assumed; (2) Kerékjártó (1919; Constantin–Kolev 2003): a finite-order orientation-preserving homeomorphism of $S^2$ is conjugate to a rotation, so the order-4 clock ( $h(A_3)=4$ ) is topologically $z \mapsto iz$ ; (3) isometry $\Rightarrow$ conformal $\Rightarrow$ Möbius: an orientation-preserving isometry of a Riemannian surface is holomorphic, $\text{Aut}(\mathbb{P})=\text{PSL}(2, \mathbb{C})$ ; (4) order-4 Möbius $= z \mapsto iz$ (verified: projective order 4, fixed $\{0, \infty\}$ , multiplier $i$ , free orbit $\mu_4$ ). So QGEO.CONF.01 is <i>implied</i> by the milder isometry premise; the new residual QGEO.ISO.01 (the seam transport is a metric-compatible holonomy preserving the RP inner product) does not name $\mathbb{P}/\mu_4$ and is milder, its surface realisation from the raw seam still [O][E][O] |
| v181_clock_is_conformal_symmetry.py | The FINAL honest reduction + the explicit identification of BEDROCK. The isometry premise QGEO.ISO.01 (v180) is weakened one more genuine step — to a CONFORMAL-symmetry premise QGEO.SYM.01 — via equivariant uniformisation (Nielsen realisation, finite cyclic on genus-0): a <i>conformal</i> automorphism (strictly weaker than an isometry — every isometry is conformal, conformal allows any positive scale) already suffices to put the order-4 clock in the form $z \mapsto iz$ . The clock is the Coxeter element of $W(A_3)=S_4$ (v117), order $h(A_3)=4= \mu_4 $ , the $\mu_4$ deck, and a deck transformation preserves the pulled-back conformal structure by definition. So below QGEO.SYM.01 the residual is <i>definitional</i> , not a missing theorem: 'the seam's conformal structure <i>is</i> the $\mu_4$ -deck structure of the carrier clock' (the carrier $\mu_4$ glue is the conformal monodromy of the seam) — a physical/definitional identification tying P2 to the seam's conformal geometry, not reducible further without relabeling. The chain<br>REALIZE(v175) $\rightarrow$ theorem(v176) $\rightarrow$ MARKS+KERNEL(v177) $\rightarrow$ finite<br>cores(v178) $\rightarrow$ CONF.01(v179) $\rightarrow$ ISO.01(v180) $\rightarrow$ SYM.01(v181) has reached bedrock; we stop here honestly [E][O]  |

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v182_reviewer_residual_map.py   | The four external-review concerns reduce to the two already-named residuals + one data-only item. $A$ (mapping $2D \rightarrow 4D$ ) [E]/[C]: the Plücker readout $11 = \sum_{k \leq 2} \binom{4}{k} = \dim S^+ - g_{\text{car}} = 16 - 5$ (QBL count, v174) and the holographic reduction give $A = \text{QGEO.SYM.01} + F_{\text{transfer}}$ . $B$ (UV gravity) [E]: ‘gravity = geometric boundary readout’ is QGEO.SYM.01. $C$ (grammar tuning) [E]/[C]: frozen (v84) + minimal + over-determined (the anchor $a=(1, 1, 2)$ in $\geq 6$ independent not-selected-for structures) is look-elsewhere-resistant, but the residual falls only to out-of-sample data (JUNO/CMB-S4). $D$ (Koide Möbius flow) [E]/[C]: the Möbius nature is forced by $\text{Aut}(\mathbb{P}) = \text{PSL}(2, \mathbb{C})$ on the deck, $t \sim 2.84$ only locates the point, and the missing RG generator is $F_{\text{transfer}}$ , so $D = \text{QGEO.SYM.01} + F_{\text{transfer}}$ . NET: three reduce onto $\{\text{QGEO.SYM.01}, F_{\text{transfer}}\}$ , one waits for data — a unification of the concern structure, not a closure (premises stay [O]/[C]) [E][C] |
| v183_koide_f_corner_transfer.py | The Koide source→pole factor $\frac{53}{54}$ has an <i>operator</i> origin (external-review proposal, validated): $u_{\text{pole}}/u_{\text{source}} = a^T(R+Q)\mathbf{1}/(2\mathbf{1}^T R a) = 53/(2 \cdot 27) = \frac{53}{54}$ . (1) $\mathbf{1}^T R a = 27$ is the $E_6 \times A_2$ cubic family block ( $248 = \dim E_6 \cdot 78 + \det R \cdot 8 + 2 \cdot 27 \cdot N_{\text{fam}}$ ); (2) $F=R+Q$ is the <i>missing</i> Sheet-Diamond corner $M(1, 1)$ with $\det B_F = 52 = \dim F_4$ (v80) and anchor response $a^T(R+Q)\mathbf{1} = 53 = 52+1$ ; (3) $\frac{53}{54} = 1 - \frac{1}{2N_{\text{fam}}^3}$ exactly ( $54=2 \cdot 27$ ); (4) negative control: only $F$ gives 53 ( $R/Q/K/L \rightarrow 32/21/35/56$ ). Upgrades FR.KOIDE.03 from a bare guess to an operator identity; [E] the factor is exact, [C] the leptonic source→pole reading the $F$ corner stays an $F_{\text{transfer}}$ conjecture [E][C]                                                                                                                                                                                                                              |
| v184_etaB_anchored_boltzmann.py | Honest test of the external-review $\eta_B$ proposal ( $M_1=M_R\phi_0^4$ , $\tilde{m}_1=m_3/A_\Lambda$ ) — firewall verdict: <i>sharper scenario</i> , not a closure. The washout anchors plausibly ( $\tilde{m}_1=m_3/A_\Lambda=m_3/10 \approx 5 \text{ meV}$ , $A_\Lambda=10= E(K_5) $ , in the strong-washout window) [C]; but $M_1$ does <i>not</i> — $M_R$ is the seesaw scale $\sim v^2/m_3 \approx 6 \times 10^{14} \text{ GeV}$ and the nearest clean TFPT powers of $\bar{M}_{\text{P1}}$ both miss it ( $c_3$ -power off $\sim 75\%$ , $\phi_0$ -power off $\sim 40\%$ ), so $M_1=M_R\phi_0^4$ merely relocates the free input $M_1 \rightarrow M_R$ (the reviewer’s $6.0 \times 10^{-10}$ uses $M_R=1.3 \times 10^{15}$ ; the seesaw value gives $3.4 \times 10^{-10}$ , the tell that $M_1$ is unpinned). $\eta_B$ stays in the observed band so the route is viable, but the proposal cuts the free inputs from two to one, not to zero — $\eta_B$ stays [C], a sharper scenario [C]                                                                                                                                                      |
| v185_axion_relic_solver.py      | Axion relic, honest misalignment estimate: the determinant-line axion $f_a=M_{\text{scal}}/128 \approx 2.39 \times 10^{11} \text{ GeV}$ ( $m_a \approx 23.8 \mu\text{eV}$ ) can provide all dark matter, but <i>only</i> near the $\theta_i \approx 170^\circ$ hilltop where the relic is exponentially sensitive — so the axion DM branch stays a [C] scenario. The harmonic misalignment under-produces at this $f_a$ (prefactor $\sim 0.026/\theta^2$ , $\theta \sim O(1)$ gives $\sim 21\%$ of $\Omega_{\text{DM}}$ , need $\theta_{\text{eff}}^2 \sim 4.7$ ), so the hilltop anharmonic enhancement is required; near the hilltop it is exponentially sensitive, hence a scenario not a sharp prediction. $F_{\text{relic}}(f_a, \theta_i, N_{\text{DW}}) = ? \Omega_{\text{DM}}$ is a kill test for the <i>branch</i> , not the theory (no free singlet WIMP: $128=(16, 4)+(16, 4)$ ) [C][O]                                                                                                                                                                                                                                                     |
| v187_ftransfer_laws.py          | The $F_{\text{transfer}}$ discipline guard (CI-style firewall): the four continuous-transfer frontier observables — Koide, $\eta_B$ , the axion relic, $m_p/m_e + \Lambda_{\text{QCD}}$ — must <i>never</i> be typed as primitive [E] compiler predictions; each carries a [C]/[O] marker. The guard reads <code>status_ledger.csv</code> and enforces it (exact algebraic sub-parts — Koide 53/54 v183, $b_3=-7$ v159 — may be [E], the physical prediction never is). Records the four interfaces $F_{\text{pole}}/F_{\text{Boltzmann}}/F_{\text{relic}}/F_{\text{QCD}}$ and that the raster rule + frozen registry + null model bind, so no future edit can quietly promote a pretty frontier number to a closed compiler output [E]                                                                                                                                                                                                                                                                                                                                                                                                                |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v188_frontier_wording_guard.py | The frontier-wording guard (a prose sentinel, no new physics): v187 protects the ledger <i>typing</i> , this guard protects the <i>prose</i> . It forbids stale sentences whose semantics an earlier round superseded — “leptogenesis interface ([E])” (v184 retyped Route B to [C]), “closed branch also fixes the leptogenesis inputs” ( $M_R$ is the seesaw scale, not a compiler power), “relic scale $f_a, m_a$ open” (v185: the scales define the branch, the open item is the hilltop-sensitive relic abundance), “computed $Q=0.664\dots$ near, not exact” (v183 gave 53/54 an exact operator origin), “Suite now 187 modules” (the count is 187, highest ID v188; v186 skipped). Scans the 10 active documents; passes when none appear, so a frozen Zenodo release can never re-introduce half-true wording [E]                                                                                                                               |
| v189_riemann_roch_carrier.py   | The Riemann–Roch carrier reading: $(g_{\text{car}}, N_{\text{fam}}) = (5, 3)$ are the two canonical invariants of <i>one</i> object, the four-point seam divisor $D = \mu_4$ on $\mathbb{P}^1$ . [E] arithmetic: $h^0(\mathbb{P}^1, \mathcal{O}(\mu_4)) = \deg + 1 = 5$ (function side) and $\text{rank } H_1(\mathbb{P}^1 \setminus \mu_4) = \deg - 1 = 3$ (cycle side, already QGEO.COHO.M.01/v177); $g_{\text{car}} = 5 = \text{rank}(D_5)$ (the carrier is the $\mathfrak{so}(10)$ half-spinor, $\text{rank } D_5 + \text{rank } A_3 = 5 + 3 = 8, \mathfrak{v}1$ ), $N_{\text{fam}} = 3$ . [C]: reading the carrier as the meromorphic seam-mode space $H^0(\mathbb{P}^1, \mathcal{O}(\mu_4))$ (less number, more geometry) is matched by $\text{rank}(D_5) = 5$ , but the physical identification is conjectural and does <i>not</i> replace the over-determined $g_{\text{car}} = 5$ (Pascal/bootstrap/Lean) — a fourth, geometric reading [E][C] |
| v190_nariai_entropy_bound.py   | The one-line Nariai entropy bound: the Schwarzschild–de Sitter entropy ratio $S_{\text{tot}}/S_{\text{dS}} = (x^2+1)/\Phi_3(x)$ ( $x=r_b/r_c$ ; $\Phi_3=x^2+x+1$ the $N_{\text{fam}}=3$ cyclotomic, already in tfpt_horizon_readouts) satisfies $S_{\text{tot}} \geq \frac{2}{3}S_{\text{dS}}$ with equality exactly at the Nariai merge $x=1$ , via the perfect square $3(x^2+1) - 2\Phi_3(x) = (x-1)^2 \geq 0$ — a variation-free proof of the entropy floor (global minimum on $x>0$ is $2/3 =  Z_2 /N_{\text{fam}}$ ) [E]                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v191_universal_branch_line.py  | The universal branch line, honestly typed [C] — an exact affine <i>relabeling</i> , not a theorem. The map $q = \frac{7}{2} + \frac{N_{\text{fam}}^2}{2}m$ carries the SdS branch points $m = \pm 1/N_{\text{fam}}$ onto the flavor branch points $\{2, 5\} = \{ Z_2 , g_{\text{car}}\}$ ( $m=0 \rightarrow 7/2$ ). The arithmetic is exact, but the map exists for <i>any</i> two pairs of points (two intervals are always affinely equivalent), so the slope $N_{\text{fam}}^2/2$ and midpoint $7/2$ are <i>determined</i> by the data, not forced predictions; a decoy pair $\{3, 4\}$ admits an equally exact map (negative control). The genuine shared content — the $2/3 =  Z_2 /N_{\text{fam}}$ ramification of the mass $\leftrightarrow$ transport double cover — is already established. Recorded as a [C] alignment, never promoted to [E] [C]                                                                                             |
| v192_qgeo_energy_clock.py      | The energy-conserving-clock reformulation, honestly typed: QGEO.ENERGY.01 ( $\rho^* \Lambda_\Sigma \rho = \Lambda_\Sigma$ — the carrier clock preserves the Calderón/DtN energy form) <i>relocates</i> the bedrock QGEO.SYM.01 to a more checkable operator identity, but does <i>not</i> eliminate it. The downstream chain (conformality $\rightarrow$ Möbius $\rightarrow z \mapsto iz \rightarrow \mu_4 \rightarrow$ QGEO.SYM.01) already exists (v180/v181); the new upstream link (energy invariance $\Rightarrow$ conformality in 2D) is checkable on the DtN operator $\Lambda =  k $ . But ‘ $\rho$ preserves $\Lambda$ ’ is plausibly equivalent to ‘ $\rho$ is the conformal deck’, so it is a sharper restatement, not a theorem, unless $\rho$ is independently defined and the invariance independently proven (open). Bedrock stays [O]                                                                                                  |
| v193_qgeo_energy_commutator.py | QGEO.ENERGY.02: the energy- <i>commutator</i> contract (the non-circular sharpening of v192): $[\rho, \Lambda_\Sigma] = 0$ on the rank-8 Calderón polarisation, $\rho$ the carrier clock, $\Lambda_\Sigma$ the DtN energy form of the <i>raw</i> RP seam. Three sub-claims: (1) [E] $\rho$ is carrier-defined (Coxeter of $W(A_3)=S_4$ , order $4= \mu_4 $ , v117), not imported from the seam; (2) [O] the non-circularity hinge — $\Lambda_\Sigma$ must be the <i>raw</i> RP-seam DtN, not the $\mu_4$ normal form; (3) [E] $[\rho, \Lambda_\Sigma]=0$ forces the $(1, 2, 3)$ grading on $H^1$ (QGEO.COHO.M.01). Exact [E] rider: the induced $k=(\ln m)/(12\pi)$ v150 reproduces $c_3/2$ iff $\ln m=q(A_3)=\frac{3}{4}$ (FAMILY), not $q(D_5)=\frac{5}{4}$ (carrier, off by $5/3$ ) — gravity is family-geometry-induced. Proof target [O]; if proven, QGEO.SYM.01 becomes an energy-rigidity theorem [O]                                            |

|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v194_raw_seam_dtn_<br>rp.py                  | QGE0.DTN.01 — subclaim 2 of v193 (“the raw RP-seam DtN is RP-definable”) tackled: a <i>reduction</i> , not a closure. (1) [E] finite core: $\rho: z \mapsto iz$ on $H^1 = \langle w_1, w_2, w_3 \rangle$ , $w_k = z^{k-1} dz / (z^4 - 1)$ , acts as $\rho^* w_k = i^k w_k$ (characters $i, -1, -i$ distinct), so $[\rho, \Lambda_\Sigma] = 0$ on $H^1$ (v177). (2) [E] hinge met: the DtN/transfer operator is RP-canonical (Osterwalder–Schrader, v54) on a quasi-free seam state (v155), so $\Lambda_\Sigma$ is RP-definable without assuming $\mathbb{P}^1 \setminus \mu_4$ . (3) [O] residual relocates: full- $L^2$ commutation $\Leftrightarrow$ Bisognano–Wichmann geometric modular flow of the quasi-free seam state (must be intrinsic, else re-circulates). QGE0.SYM.01 reduces from a definitional postulate to intrinsic BW modular covariance — sharper, still [O], not closed [O]                                                                                                                                                                                                                                                                                    |
| v195_marks_<br>lefschetz_<br>character.py    | QGE0.MARKS.02 — a Lefschetz/character derivation of the four seam marks (review path 2): instead of positing $D_4$ marks, they are <i>forced</i> to be a free $\mu_4$ orbit. [E]: $\rho: z \mapsto iz$ (order 4) fixes only $\{0, \infty\}$ ; $H^1 = \chi_1 + \chi_2 + \chi_3$ (the $A_3$ exponents (1, 2, 3), v177) has no trivial character $\Rightarrow$ no puncture at a fixed point; $\text{rank } H_1 = n - 1 = 3 \Rightarrow n = 4 \Rightarrow$ exactly one free orbit $\Rightarrow$ marks = $\mu_4$ (cross-ratio 2); $\text{Tr}(\rho H^1) = i + i^2 + i^3 = -1$ , $L(\rho) = 1 + 1 = 2 = \# \text{fixed}$ . [O] residual relocates from “the seam is $\mathbb{P} \setminus \mu_4$ (geometric)” to “ $H^1$ carries the $A_3$ -exponent rep” — less circular [E][O]                                                                                                                                                                                                                                                                                                                                                                                                           |
| v196_seam_energy_<br>functional.py           | QGE0.VARI.01 — the $E_{\text{fail}}$ variational functional (review path 1), a numerically-testable sharpening of the v194/ENERGY.02 target: $E_{\text{fail}} = \ [\rho, \Lambda_\Sigma]\ _{HS}^2 + \ \rho^4 - 1\ ^2 + \ \Theta \rho \Theta - \rho^{-1}\ ^2$ , with $E_{\text{fail}} = 0 \Leftrightarrow$ the QGE0.SYM.01 conditions. [E] on the finite $H^1$ block ( $\rho = \text{diag}(i, -1, -i)$ , $\Lambda$ diagonal, $\Theta = \text{conj}$ ) all three vanish $\Rightarrow E_{\text{fail}} = 0$ ; [E] a $\mu_4$ -breaking $\Lambda$ or non-order-4 $\rho$ gives $E_{\text{fail}} > 0$ ( $\mu_4$ a true minimiser); [E] the zero locus is the seam-deck conditions; [O] the full-operator minimisation is the v194 Bisognano–Wichmann residual — a discretisable handle on the open bedrock, a target not a closure [E][O]                                                                                                                                                                                                                                                                                                                                                   |
| v197_rr_carrier_<br>clifford_d5.py           | ARCH.RRCAR.02 — hardening the Riemann–Roch carrier from $g_{\text{car}}$ to $D_5$ itself (review point 7): the 5-dim carrier mode space $C_{\text{car}} := H^0(\mathbb{P}^1, \mathcal{O}(\mu_4))$ generates the $\mathfrak{so}(10) = D_5$ half-spinor by its even Clifford algebra. [E] $\dim \Lambda^{\text{even}}(\mathbb{C}^5) = \binom{5}{0} + \binom{5}{2} + \binom{5}{4} = 1 + 10 + 5 = 16 = 2^{g_{\text{car}} - 1} = \dim S^+$ ; the $\mathfrak{so}(10) = D_5$ half-spinor $2^4 = 16 = S^+ = \Lambda^{\text{even}}(C_{\text{car}})$ ; closes the chain $\mu_4 \rightarrow g_{\text{car}} \rightarrow D_5$ from one four-point divisor (cycle side $\text{rank } H_1 = 3 = N_{\text{fam}}(A_3)$ ; function side $h^0 = 5 = g_{\text{car}}$ ; Clifford spinor $16 = D_5$ half-spinor = carrier). [C] “carrier = Clifford spinor of the seam mode space” stays physical (as v189), does not change the over-determined $g_{\text{car}} = 5$ [E][C]                                                                                                                                                                                                                              |
| v198_modular_<br>commutator_<br>reduction.py | QGE0.MODULAR.01 — cracking the bedrock to a state-invariance. The v194 residual ( $[\rho, \Lambda_\Sigma] = 0$ on full $L^2$ , framed as Bisognano–Wichmann with a circularity worry) is (a) made <i>exact</i> at the principal-symbol level and (b) reduced via Tomita–Takesaki to a clean state-invariance. [E] the DtN principal symbol $ k  = \sqrt{-d^2}$ is $\text{diag}( n )$ and the clock $\rho: z \mapsto iz$ is $\text{diag}(i^n)$ in the Fourier basis — both diagonal $\Rightarrow [\rho,  k ] = 0$ exactly on <i>all</i> of $L^2$ ; [E] Tomita–Takesaki: $[\rho, \Lambda_\Sigma] = 0$ follows from $\omega \circ \rho = \omega$ (the modular $\Delta$ is intrinsic to $(M, \Omega)$ ; a state-preserving symmetry commutes with it), needing <i>no</i> conformal covariance — removes the BW circularity; [E] the finite $H^1$ block is already $\mu_4$ -invariant (v177). [O] residual: the full raw seam state is $\mu_4$ -invariant ( $\omega \circ \rho = \omega$ ) $\Leftarrow$ the Gaussian bulk measure is deck-invariant = operational QGE0.SYM.01. Sharpest non-circular form; not a closure (a foundational symmetry cannot be derived from nothing) [E][O] |

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v199_seam_state_invariance.py   | QGE0.STATE.01 (work package A) — attacking $\omega \circ \rho = \omega$ directly on the raw seam: a further localising reduction, not a closure. [E] setup non-circular ( $\rho = \text{Coxeter of } W(A_3) = S_4, \rho^4 = 1$ , an automorphism of the raw CAR algebra; both carrier-side, no seam geometry); [E] ground-state reduction $\omega \circ \rho = \omega \Leftrightarrow [\rho, H_1] = 0$ ( $C_\Sigma = \frac{1}{2}(1 + \text{sgn } H_1)$ ); [E] character criterion: $[\rho, H_1] = 0 \Leftrightarrow H_1$ block-diagonal in the four $\mu_4$ -character classes $\{n \equiv r \pmod{4}\}$ ; principal symbol $ k  = \text{diag}( n )$ passes automatically. [O] residual: the bounded sub-principal symbol has <i>no</i> off-character matrix elements — non-circular, sharply typed, holds on $H^1$ (v177); not a closure [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v200_seam_variational_scan.py   | QGE0.VARI.02 (work package B) — the discretised variational test: v196 had $E_{\text{fail}} = 0$ at the $\mu_4$ config on the fixed block; here the clock angle is free and $E_{\text{fail}}$ is minimised over it. [C] scanning $E_{\text{fail}}(\theta) = \ \rho(\theta)^4 - 1\ ^2 + \text{faithfulness over } \theta \in (0, \pi)$ gives the unique minimum at $\theta = \pi/2$ ( $E_{\text{fail}} = 0$ : order-4 <i>and</i> three distinct characters $i, -1, -i$ = the $(1, 2, 3)$ grading); decoys $(0, \pi, \pi/3, 2\pi/3)$ all lose. So $\arg \min E_{\text{fail}}$ = the $\mu_4$ normal form. [E] consistent with v196/v199/v198. [O] a numerical sign on the finite $H^1$ grading, not the full operator-valued minimisation (the v199 residual) [C][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| v201_seam_subprincipal_marks.py | QGE0.SUBPRIN.01 — the v199 bedrock residual reduced one genuine step further: block-diagonality of the sub-principal symbol is <i>not</i> an independent postulate. [E] the seam DtN is $\Lambda =  k  + M_f$ , $M_f$ = multiplication by a curvature function $f(\theta)$ (standard Steklov sub-principal), so $\langle n   M_f   n' \rangle = f_{n-n'}$ . [E] $M_f$ is $\mu_4$ -character-block-diagonal $\Leftrightarrow f$ has Fourier support only on modes $\equiv 0 \pmod{4}$ $\Leftrightarrow f$ is $\mathbb{Z}_4$ -invariant ( $ k $ already commutes, v198). [E] a $\mu_4$ -mark sum $f(\theta) = \sum_{j=0}^3 g(\theta - 2\pi j/4)$ has $f_m = 4g_m[m \equiv 0 \pmod{4}]$ for <i>any</i> profile $g$ — automatically $\mathbb{Z}_4$ -invariant, so (v195 marks = $\mu_4$ orbit) <i>forces</i> the sub-principal symbol block-diagonal; negative controls: 3 marks ( $\mathbb{Z}_3$ ) and 4 generic marks break it. [O] new residual: $\omega \circ \rho = \omega$ reduces to ‘the DtN sub-principal symbol is mark-local (seam flat away from the $\mu_4$ marks = conformal deck v177)’, the narrowest, structurally-definitional form of QGE0.SYM.01 [E][O]                                                                                                                                                                                                                                                                                                                                                   |
| v202_rare_kaon.py               | The rare kaon sector $K \rightarrow \pi \nu \bar{\nu}$ from the TFPT CKM point ([C] downstream flavor readout, <i>not</i> a compiler power). The kernel fixes the full CKM matrix ( $s_{12} = \lambda_C$ , $s_{23} = \varphi_0 / (1 + \lambda_C) =  V_{cb} $ , $s_{13} = \lambda_C^3 / 3$ , $\delta = \pi/3 + 3\lambda_C^2 = 1.19823$ rad; v18/v88) with no flavor fit; feeding the exact point into the standard Brod–Gorbahn–Stamou short-distance formulas gives $\text{BR}(K^+ \rightarrow \pi^+ \nu \bar{\nu}) = 9.45 \times 10^{-11}$ and $\text{BR}(K_L \rightarrow \pi^0 \nu \bar{\nu}) = 3.33 \times 10^{-11}$ . [E] CKM point + exact apex $(\bar{\rho}, \bar{\eta}) = (0.1374, 0.3509)$ , $\lambda_t = V_{ts}^* V_{td}$ ; [C] the branching ratios ( <i>not</i> parameter-free — $X_t, P_c, \kappa_\pm$ are external EW/QCD input); [E] $\text{BR}(K^+)$ $\text{BR}(K^+) = 9.45 \times 10^{-11}$ lands ON the NA62 2016-2024 combination $(9.6_{-1.8}^{+1.9}) \times 10^{-11}$ (La Thuile 2026), $+0.08\sigma$ (the 2016-2022 obs $(13.0_{-3.0}^{+3.3}) \times 10^{-11}$ was $\sim 1.2\sigma$ above) — a strong consistency hit, but an $F_{\text{transfer}}$ bridge, not a unique TFPT-vs-SM discriminator (SM $(8.6 \pm 0.4) \times 10^{-11}$ also inside the NA62 error); [E] Grossman–Nir ratio $0.352 \ll 4.3$ ; [X] dated kill test: a stable NA62 $\text{BR}(K^+)$ outside $[7, 12] \times 10^{-11}$ , or a KOTO-II $\text{BR}(K_L)$ off the GN point, breaks the flavor bridge (core untouched) [C][X] |

| Script                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v203_eht_achromatic.py    | The EHT achromatic polarization-rotation intercept $\beta_{\text{BH}}$ around a horizon-scale black hole — the surviving core of the old UFE/BH notes ( <i>not</i> the RN-type metric, superseded by Nariai/seam=horizon v101–v104/v190; only the polarization signature). [E] the coupling is a compiler number: $\beta_{\text{BH}}(r)=Q_e^{\text{eff}}Q_m^{\text{eff}}/(256\pi^4r^2)=16c_3^4(Q_eQ_m/r^2)$ , $16c_3^4=1/(256\pi^4)$ exactly. [E] $\alpha$ -kernel cross-link: $16c_3^4=\delta_{\text{top}}/3$ , $\delta_{\text{top}}=48c_3^4=3/(256\pi^4)$ — the <i>same</i> top-form coefficient that fixes the $\alpha$ -kernel precision-zone correction (one row from $\beta_{\text{rad}}=\varphi_0/4\pi$ ). [C] TFPT fixes the $1/r^2$ profile, achromaticity, and sign-flip under $E\cdot B$ reversal; the amplitude $Q_eQ_m$ is an MHD/GR weight, not a compiler output. [X] dated kill test: the residual intercept must pass three nulls (frequency/achromatic, spatial $1/r^2$ , sign-flip); a null-consistent residual after honest GRMHD subtraction falsifies the channel (core untouched) [E][C][X] |
| v204_muon_seam_g2.py      | The muon anomalous magnetic moment $a_\mu=(g_\mu-2)/2$ as a seam vertex readout ([C] downstream, <i>not</i> a compiler power; archive integration of the old muon- $g-2$ note). The carrier fixes the second-order defect $\delta_2=B\gamma\delta_{\text{top}}^2=\frac{5}{4}\delta_{\text{top}}^2$ ( $\delta_{\text{top}}=\Omega_{\text{adm}}c_3^4=48c_3^4=3/256\pi^4$ , $v2/v23$ ; $B\gamma=\frac{3}{2}\cdot\frac{5}{6}=\frac{5}{4}$ , v51); the seam-loop projection $a_\mu^{\text{seam}}=\delta_2/(2\pi)=45/(524288\pi^9)\approx 2.879\times 10^{-9}$ . [E] the value is an exact compiler number ( $\delta_2=4!\text{Tr}_{S^+}(X^2)c_3^8$ , $\text{Tr}=120=5!$ ); [C] the identification of $\delta_2/(2\pi)$ as a magnetic vertex ( $1/2\pi=4c_3$ ) is a physical bridge; [E] $0.81\sigma$ vs dispersive $\Delta a_\mu=(2.49\pm 0.48)\times 10^{-9}$ ; [C] HONEST: lattice/CMD-3 HVP shrinks it ( $\sim 1.5\times 10^{-9}$ ), the fixed value then $\sim 1.5\sigma$ high; [X] dated kill test: a converged $\Delta a_\mu$ outside $2.879\times 10^{-9}\pm 0.5\times 10^{-9}$ excludes the mechanism [E][C][X] |
| v205_xi_threequarter.py   | $\xi=c_3/\varphi_{\text{tree}}=3/4$ : an <i>independent</i> route to the gravitational $3/4$ (archive integration of the old Eliminating- $K$ note). The torsion-compression ansatz $\kappa^2=\xi\varphi_0/c_3^2$ with the Einstein limit $\kappa^2=8\pi G$ fixes $\xi=8\pi c_3^2/\varphi_0=c_3/\varphi_0$ (since $8\pi c_3^2=c_3$ ), and at tree level $\varphi_{\text{tree}}=1/(6\pi)$ this is exactly $3/4$ . [E] tree identity $\xi=c_3/\varphi_{\text{tree}}=3/4$ ; [E] Einstein-limit reduction $8\pi c_3^2=c_3\Rightarrow G$ is an output; [E] over-determination $3/4=q(A_3)=N_{\text{fam}}/ \mu_4 =\ln(m/\mu)$ (v152 $k=c_3/2$ ) — the torsion-compression $\xi$ and the gapped EH replica are two independent appearances of the same gravitational $3/4$ ; [E] with the retained seed $\xi=c_3/\varphi_0=0.748303$ ( $-0.226\%$ ); [C] the $\kappa^2=\xi\varphi_0/c_3^2$ ansatz is the bridge, the modern derivation is v152/v68, $1/G$ stays the one anchor (v60/v153) [E][C]                                                                                                                          |
| v206_h0_lambda_branch.py  | The cosmological-constant Letter branch: the seam number $\delta_\Sigma=m_1e^{-2\pi\alpha^{-1}/3}$ with the lowest block $m_1=\Omega_{\text{adm}}=48$ , the Planck-convention split, and the quantitative $H_0=66.5\text{--}67.1$ (archive integration of the tfpt-31 CC note; sharpens the qualitative $H_0$ -vs- $\Lambda$ row). [E] $\delta_\Sigma^{\text{lead}}=48e^{-2\pi\cdot 137.036/3}\approx 1.085\times 10^{-123}$ ; [E] convention split $M_{\text{Pl}}^4/\bar{M}_{\text{Pl}}^4=(8\pi)^2=631.65$ (unreduced vs reduced — must be displayed); [E] $\rho_\Lambda=M_{\text{Pl}}^4\delta_\Sigma\approx 2.4\times 10^{-47}\text{ GeV}^4$ (observed vacuum order); [E] 123-orders cross-link $ \log_{10}\delta_\Sigma \approx 122.96$ , consistent with the v60 split 122.948; [C] under flatness closure $H_0^{\text{lead}}=66.51$ , $H_0^{\text{disc}}=67.10$ — $1.6\text{--}0.5\sigma$ below Planck, $\sim 6\sigma$ below SH0ES: the Hubble tension is <i>not</i> relieved by raising the vacuum scale; $H_0$ uses imported $\Omega_b, \omega_{\text{DM}}$ , a [C] readout [E][C]                          |
| v207_asymptotic_safety.py | Asymptotic Safety as a <i>second</i> , independent, [O] route to the metric sector (archive integration of the old Five-Problems note). The current theory closes QG via the discrete seam-net/AQFT programme (v175; open premise QGEO.REALIZE.01); this records a complementary continuum-FRG argument that a non-Gaussian UV fixed point exists from the same axioms — a plausibility cross-check, <i>not</i> load-bearing, does <i>not</i> close $G_{\text{metric}}$ . [E] the axion coupling is fixed and small $y^2=16c_3^2=1/(4\pi^2)=0.025330$ exactly ( $g_{a\gamma\gamma}=-4c_3$ from the cubic); [E] existence by IVT: $\partial_t g/g=2+\eta_R$ is $+2>0$ as $g\rightarrow 0$ and $<0$ at large $g$ (torsion $K^2$ damping) $\Rightarrow$ a root $g_*>0$ ; [E] $g_*=2/a_1>0$ finite, Reuter-type $O(1)$ , no new free input; [O] HONEST: a continuum-FRG ansatz the discrete-compiler theory did <i>not</i> adopt, primary stays the seam-net (v175) [E][O]                                                                                                                                             |

| v208_bh_thermodynamics.py     | Black-hole thermodynamics from the seam: the modular Hawking temperature and the scalaron-corrected Wald entropy (archive integration of the dropped tfpt-42 stationary-horizons section, re-typed through the current Tomita–Takesaki seam work v198/v199). [E] modular $T_H: \Delta^{it}=e^{-2\pi t K_H}$ (Bisognano–Wichmann) $\Rightarrow$ KMS at $\beta=2\pi$ and $T_H=\kappa/(2\pi)$ ; the $2\pi$ is the seam unit $1/(4c_3)$ ( $1/2\pi=4c_3$ , v58), reproducing $T_H=c_3/M$ (v57); seam $\leftrightarrow$ horizon identification [C]; [E] Wald entropy: with the induced $f(R)=R+R^2/(6M_s^2)$ ( $M_s=c_3^{7/2}\bar{M}_{\text{Pl}}$ , v28), $S_W=(f_R A)/(4G)=(A/4G)(1+R_h/3M_s^2)$ — leading $A/4G$ is the $c_3$ area law ( $1/4=1/ \mu_4 $ ), the correction an exact scalaron consequence; [E] SdS $T_H=(1/4\pi r_h)(1-\Lambda r_h^2)$ , $1/4\pi=2c_3$ ; [E] area law $S_{BH}=M^2/(2c_3)=4\pi M^2=A/4G$ [E][C]                                                                                                                                                                                                                                                                                                                                                 |
| v209_bh_regular_core.py       | The black hole as a seam fixed point (topological defect), <i>not</i> a singularity: the honest [O] synthesis of the old Five-Problems BH picture, with the superseded torsion/RN-vortex metric dropped (RN-type metric superseded by Nariai/seam=horizon v101–v104/v190; cf. v203). Built entirely from established suite atoms. [E] no singularity = seam fixed point: the gapped attractor multiplier $\lambda_2=(2/3)^6=64/729$ with gap $\Delta=6\log(3/2)>0$ (v56) — the core is a fixed point, $\rho\rightarrow\infty$ replaced by $\varphi\rightarrow\varphi_*$ [C]; [E] maximal BH = anchor: Nariai cubic $t^3-3t+2=(t-1)^2(t+2)$ , roots $(1, 1, -2)$ = the traceless projection of $a=(1, 1, 2)$ (v101/v190); [E] information stays in the boundary field: Page recovery decays at $\lambda_2=(2/3)^6$ per step (v54) [C]; [E] holographic remnant $S_{BH}=A/4G$ , $1/4=1/ \mu_4 $ [C]; [O] HONEST: a qualitative structural synthesis (reuses v54/v56/v57/v101/v190), <i>not</i> load-bearing, <i>not</i> a metric [E][O]                                                                                                                                                                                                                                     |
| v210_mark_local_dtn.py        | A numerical <i>sharpening</i> of v201/QGEO.SUBPRIN.01 on <i>realistic</i> Steklov curvature profiles, carried to the quasi-free <i>state</i> level (the actual $\omega\rho=\omega$ , not just $[\rho, \Lambda]=0$ ); <i>not</i> a closure of QGEO.SYM.01. A real von-Mises bump $g(\theta)$ at a puncture, summed over the four $\mu_4$ marks $f(\theta)=\sum_{j=0}^3 g(\theta-j\pi/2)$ , builds the Steklov DtN $\Lambda= D_\theta +M_f$ . [E] every off-(mod 4) Fourier coefficient of the real $f$ vanishes to $<10^{-16}$ (exact 4-fold cancellation), although $g$ has all modes. [C] $\ [\rho, \Lambda]\  < 10^{-15}$ . [C] <i>state invariance</i> (new vs v201): the quasi-free covariance $C=\frac{1}{2}(1+\text{sgn } H_1)$ satisfies $\rho C\rho^\dagger=C$ to $<10^{-13}$ — the state, not just the operator, is clock-invariant. [C] negative controls (single off-centre bump, $\mathbb{Z}_3$ source, 4 generic marks) break both by $O(1)$ ; convergence stable for $N\in\{16, 32, 64\}$ . [O] certifies ‘mark-local DtN $\Rightarrow \omega\rho=\omega$ ’ for concrete profiles <i>and</i> at the state level; the premise that the physical seam <i>is</i> mark-local stays [O] — the narrowest definitional form of QGEO.SYM.01, not its closure [C][O] |
| v211_axion_spine_angle.py     | Axion DM, the spine-angle branch $\theta_i = \pi N_{\text{fam}}/g_{\text{car}} = 3\pi/5$ ( $108^\circ$ ): an alternative, more robust misalignment angle than the determinant-line hilltop $\theta_i \approx 170^\circ$ (v185, which over-produces $\Omega_a h^2 \approx 0.66$ ). [E] rational motive $\theta_i = 3\pi/5$ exactly (spine quotient $3/5$ , no fit); [E] the v185 finite-T solver ( $\theta=1 \rightarrow 0.03$ ) reaches $\Omega_{\text{DM}}$ at $\theta \approx 106^\circ$ , so $108^\circ$ is on target (harmonic $0.03\theta^2=0.107$ ); [C] <i>robust</i> : $108^\circ$ is $62^\circ$ below the $170^\circ$ hilltop (mild-anharmonic, not exponentially sensitive); [O] an alternative ansatz to $\theta_i=\pi(1-\varphi_{\text{seam}})\approx 170^\circ$ (mutually exclusive, the full solver decides, DM.AXION.SPINE.01); [X] kill test: $\Omega_a h^2$ outside $\sim[0.08, 0.16]$ demotes the branch [E][C][O][X]                                                                                                                                                                                                                                                                                                                                   |
| v212_leptogenesis_decouple.py | Leptogenesis, the scalaron-decouple branch: both Boltzmann inputs share the decouple $A_\Lambda=10= E(K_5) $ — $M_1=M_{\text{scal}}\varphi_0^2/A_\Lambda \approx 8.65\times 10^9$ GeV and $\tilde{m}_1=m_3/A_\Lambda \approx 5$ meV. A cleaner [C] route than v184’s $M_1=M_R\varphi_0^4$ (which only relocated the free input to the un-pinned seesaw $M_R$ ). [E] shared decouple $A_\Lambda=10$ ; [E] $M_1=8.65\times 10^9$ GeV inside the thermal window $[3\times 10^9, 3\times 10^{10}]$ (v169); [E] $\tilde{m}_1 \approx 5$ meV, $K \approx 4.6$ strong washout; [E] Davidson–Ibarra $\varepsilon_1 \approx 8.5\times 10^{-7}$ , $\eta_B \approx 1.2\times 10^{-9}$ brackets observed $6.1\times 10^{-10}$ ; [C] HONEST: $M_1$ uses only $\{M_{\text{scal}}, \varphi_0, A_\Lambda\}$ but the coupling mechanism is posited not derived; [X] kill test falls the route, not the theory (FR.ETAB.01 independent) [E][C][X]                                                                                                                                                                                                                                                                                                                                           |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v216_marks_gauss_bonnet.py    | The four seam marks <i>emerge</i> from Gauss–Bonnet (QGEO.MARKS.03), executing the K1 lever of the v215 kill-test. [E] mark count = $2\chi$ : $\mathbb{Z}_2$ branch points (deficit $\pi$ ) on a flat sphere ( $\chi=2$ ) give $n\pi = 2\pi\chi = 4\pi \Rightarrow n = 2\chi = 4 =  \mu_4  = e_1(a) = N_{\text{fam}}+1$ (the same $\chi=2$ as the 8 in $c_3=1/(8\pi)$ ). [E] the Euclidean sphere 2-orbifolds ( $\chi_{\text{orb}}=0$ ) are exactly $(2, 3, 6), (2, 4, 4), (3, 3, 3), (2, 2, 2, 2)$ . [E] all-order-2 (the $ \mathbb{Z}_2 $ sheet branch) $\Rightarrow$ uniquely $(2, 2, 2, 2)$ ; [E] $N_{\text{fam}}=3$ (rank $H^1=\#\text{marks}-1$ ) $\Rightarrow$ uniquely $(2, 2, 2, 2)$ , picking the 4-mark square over the 3-mark hexagonal $(3, 3, 3)$ ; [E] a free order-4 deck $\Rightarrow$ uniquely $(2, 2, 2, 2)$ — three independent selectors converge. [O] residual: the square modulus (cross-ratio $2 \Rightarrow j=1728$ , v214) needs the one order-4 carrier input. The mark count + equality are now derived; does <i>not</i> close QGEO.REALIZE.01                                                                                                                                                    |
| v217_marks_emergence_scan.py  | The <i>numerical</i> emergence scan (QGEO.EMERGE.01, the sibling of v216 as v210 is to v201): with the number of marks $n$ and their positions free, the 4-equally-spaced (square) configuration is the joint minimiser of {clock-invariance + 3-family cohomology + transfer gap $(2/3)^6$ } on the actual seam DtN/state. [C] $n=4$ equally-spaced $\Rightarrow \ \rho_4 C \rho_4^\dagger - C\  \sim 10^{-14}$ (clock-invariant state); [C] family count selects $n=4$ (scan $n \in \{2..8\}$ , only $n-1=3=N_{\text{fam}}$ ; $n=3 \rightarrow 2$ families = hexagonal, excluded; $n=5 \rightarrow 4$ ); [C] gap: $\mu_4$ -equivariant $\Rightarrow$ diagonal in the cusp basis (deck-average off-diagonal $\sim 10^{-16}$ ), cusp weights $\{0, \frac{1}{3}, \frac{2}{3}\} \Rightarrow$ transfer $(1-w)^6 = \{1, (2/3)^6, (1/3)^6\}$ , gap $(2/3)^6 = 64/729$ ; [C] position scan: the square minimises the defect (square $\sim 10^{-14}$ vs off-square $\sim 0.4$ ); [C] negative controls $n=3, 5, 6$ . [O] confirms the emergence on the real DtN (number scanned, positions free); selector = the 3-family/gap structure (carrier input); executes K1 numerically, does <i>not</i> close QGEO.REALIZE.01. Python-only |
| v218_diamond_axis_geometry.py | Diamond axis geometry: the Sheet Diamond (v94) is a discrete geometry with two axes around the centered cross (v95: $C$ center, $U$ winding, $V$ sheet), $F$ the transfer completion. Three exact [E] lemmas + honest audit/heuristic typing, no new numbers. [E] AXIS CURVATURE: $\det(C+xU)=14+6x$ linear (slope $6= R^+(A_3) $ ), $\det(C+yV)=14+14y+4y^2$ quadratic, 2nd difference $8=\text{rank } E_8$ ; $\det B(C+xU)=2\det(C+xU)$ , anchor-block sheet curvature $6= R^+(A_3) $ . [E] PLÜCKER LADDER: $\text{Pl}(K)=(-1, 6, 4) \rightarrow \text{Pl}(C)=(0, 14, 14) \rightarrow \text{Pl}(F)=(1, 22, 30)$ , steps $(1, 8, 10)=(N_\Phi, \text{rank } E_8, A_\Lambda)$ and $(1, 8, 16)=(N_\Phi, \text{rank } E_8, \dim S^+)$ (identity [E], transfer reading [C]). [E] SPECTRAL RAMIFICATION: $\text{Disc}(\chi)=q(r)^2\text{Disc}(q)$ for $Q, K, C, F$ ; squares $(1, 3, 4, 6)$ , kernels $(13, 48, 65, 105)$ with $48=\Omega_{\text{adm}}$ , $105=N_{\text{fam}}g_{\text{car}} \cdot 7$ . [C] heuristic: $F$ the transfer-completion corner, a search principle, not a hard filter; the $G_2/F_4$ pair-sum labels stay audit-only (cf. v94/v95) [E][C]                                                                |
| v219_icosahedral_mckay.py     | McKay bedrock: <i>why</i> the atoms are $\{2, 3, 5\}$ . $E_8$ is the exceptional <i>top</i> of the McKay tower of finite $SU(2)$ subgroups ( $2T \rightarrow \hat{E}_6$ , $2O \rightarrow \hat{E}_7$ , $2I \rightarrow \hat{E}_8$ ). The McKay graph is built <i>from the group</i> : the 120 icosians close to the binary icosahedral $2I$ (element orders $\{1, 2, 3, 4, 5, 6, 10\}$ , containing the 2, 3, 5 axis orders), 9 conjugacy classes, Dixon irrep degrees $\{1, 2, 2, 3, 3, 4, 4, 5, 6\}$ (sum $30=h(E_8)$ , sum of squares $120= R^+(E_8) $ ); the natural-rep McKay adjacency <i>is</i> the affine $E_8$ graph with Kac marks = the degrees. A backward certificate of the closed $E_8$ [E], the reading that it explains $(2, 3, 5)$ [C], the raw-seam origin [O]                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| v220_cp_hexagonal_modulus.py  | CP lives in the <i>hexagonal</i> phase fiber, not the square seam deck (a geometric sharpening of red-team Target D). [E] the seam deck is the square modulus $j(i)=1728$ , $\text{Aut}=\mathbb{Z}/4$ (the $\mu_4$ clock); its exceptional partner is the hexagonal modulus $j(\rho)=0$ , $\rho=e^{i\pi/3}$ , $\text{Aut}=\mathbb{Z}/6$ , CM by $\mathbb{Z}[\omega]$ , $\arg \rho=\pi/3$ . [E] the frozen leading CKM reading $\delta=\pi/3+3\lambda_C^2=68.654^\circ$ (v88) has leading term $\pi/3=\arg \rho$ ; the $ \mathbb{Z}_2 $ alternative $\pi/3+2\lambda_C^2$ is the frozen look-elsewhere trap. The deck stays $\mathbb{Z}/4$ (v215); CP is the $\mathbb{Z}/6$ fiber, the bridge [C][E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Script                                | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v221_seam_qecc.py                     | The seam as a <i>finite recoverability</i> code (recovery rate $(2/3)^6=64/729$ ). [E] code dimension $\dim S^+=16=2^{g_{\text{car}}-1}$ ; the gapped transport $T$ on the cusp-weight 3-space (deviations $(1, -1, 0)$ and the Nariai anchor $(1, 1, -2)$ ) is symmetric, doubly stochastic (CPTP), spectrum $\{1, (2/3)^6, (1/3)^6\}$ ; on the trace-zero subspace $\ T\delta\ \leq(2/3)^6\ \delta\ $ hence $\ T^n\delta\ \leq(2/3)^{6n}\ \delta\ $ (a Knill–Laflamme-type bound); a free ratio breaks it. [C] the holographic/Petz reading (gated on the Seam–Horizon theorem) [E][C]                                                                          |
| v222_cm_norm_duality.py               | CM-norm duality: the two exceptional moduli give 41 and 7. [E] SQUARE (Gaussian $\mathbb{Z}[i]$ , $j=1728$ ): $N(g_{\text{car}}+i \mu_4 )=5^2+4^2=41=10b_1$ — the EM index <i>is</i> the Gaussian norm of the carrier-glue vector; $N(3+2i)=13=\Delta_Q$ . [E] HEX (Eisenstein $\mathbb{Z}[\omega]$ , $j=0$ ): $N(3+2\omega)=3^2-3\cdot 2+2^2=7=\text{scalaron}$ . The $(3, 2)=(\text{colour}, \text{weak})$ split generates $(5, 6, 7, 13)$ by sum / product / Eisenstein / Gauss norm; the rings are rigid (Eisenstein of $(5, 4)=21\neq 41$ ). The architecture bridge square $\leftrightarrow$ EM, hex $\leftrightarrow$ scalaron is [C][E][C]                |
| v223_coxeter_totative_clock.py        | The $\mu_4$ clock is the order-4 character of the $E_8$ Coxeter cycle. [E] $(\mathbb{Z}/30)^\times=\{1, 7, 11, 13, 17, 19, 23, 29\}$ = the $E_8$ exponents = live Coxeter phases; $\varphi(30)=8=\text{rank } E_8$ , $30=2\cdot 3\cdot 5$ . [E] $(\mathbb{Z}/30)^\times\cong\mathbb{Z}/4\times\mathbb{Z}/2$ with order-4 generator 7 ( $7^2=19$ , $7^4=1 \bmod 30$ ): a literal $\mu_4$ clock $\langle 7 \rangle=\{1, 7, 13, 19\}$ on the exponents; the conjugate pairs $m+(30-m)=30$ give $ \mu_4 =4$ invariant planes the clock permutes. Only $E_8$ has $\varphi(h)=\text{rank}$ and $h=2\cdot 3\cdot 5$ ; the seam-clock identification is [C][E][C]         |
| v224_diamond_fttransfer_path.py       | $F_{\text{transfer}}$ as <i>one</i> path on the Sheet Diamond, not four external interfaces. [E] family $M(s, t)=R+Q \text{diag}(s, t, t)$ : the corners $K=M(1, -1)$ , $C=M(1, 0)$ , $F=M(1, 1)$ lie on the sheet axis ( $s=1$ ); the sheet axis is curved $\det M(1, t)=4t^2+14t+14$ (2nd diff $8=\text{rank } E_8$ ), the winding axis $\det M(s, 0)=6s+8$ flat (slope $6= R^+(A_3) $ ); Plücker steps $(1, 8, 10)$ , $(1, 8, 16)$ . [C] $F_{\text{transfer}}$ is the $K\rightarrow C\rightarrow F$ sheet geodesic, Koide source $\rightarrow$ pole its 1-D Möbius projection (v37/v183) [E][C]                                                                |
| v225_dual_normal_frame.py             | The dual normal frame $(d, n)$ : one boundary compass for flavor and horizon, with CP as orientation. [E] $d=a^\top R^{-1}=a^\top L^{-1}=(-\frac{1}{2}, -\frac{1}{2}, 1)=-\frac{1}{2}(1, 1, -2)$ (the Nariai/horizon normal; $d\cdot 1=0$ , $d\cdot a=1$ ); $n=(5, -9, 6)$ with $n^\top R=(\det R, 0, 0)=(8, 0, 0)$ , $n^\top L=(20, 0, 0)$ (the first-generation/torsion selector). [E] oriented volume $\det(\mathbf{1}, d, n)=21=N_{\text{fam}}\cdot 7$ . [C] CP as orientation: $\text{Im } \det(\mathbf{1}, d, \rho n)=21 \sin(\pi/3)$ for $\rho=e^{i\pi/3}$ — CP sits where the magnitude bijection (Target D) fails [E][C]                                 |
| v227_degree_exponent_channel_split.py | $248=120+128$ as a magnitude/phase channel typing (replaces the over-strong $S^-$ -dark-matter reading). [E] $E_8$ exponents sum $120= R^+(E_8) $ ( <i>magnitude</i> channel); degrees $\{2, 8, 12, 14, 18, 20, 24, 30\}$ sum $128=2^{\text{rank}-1}=\text{rank}\cdot \dim S^+$ ( <i>phase/glue</i> channel); $248=120+128=\text{adj}(D_8)+\text{spinor}(D_8)$ ; $\sum \deg - \sum \exp = \text{rank}=8$ . [C] ratios+products (Target D) live in the 120 channel, the un-covered CP phases in the 128 phase/glue channel; [O] a dark-sector reading of 128 stays Frontier [E][C][O]                                                                              |
| v228_rr_index_gate.py                 | P2 as the mode space of a degree-4 seam divisor (a Riemann–Roch <i>index gate</i> ; bedrock language for P2, not a proof from nothing). [E] $\deg D=4= \mu_4 $ on $\mathbb{P}^1 \Rightarrow h^0(\mathcal{O}(D))=5=g_{\text{car}}$ (Riemann–Roch, genus 0); $\text{rank } H_1(\mathbb{P}^1\setminus 4)=3=N_{\text{fam}}$ ; $h^0+\text{rank } H_1=8=\text{rank } E_8$ , $h^0-\text{rank } H_1=2= \mathbb{Z}_2 $ ; $\Lambda^{\text{even}}(\mathbb{C}^5)=1+10+5=16=\dim S^+$ . The mode-space reading is [C], conditional on the raw seam producing the degree-4 divisor ([O], = QGEO.SYM.01) [E][C][O]                                                               |
| v229_lepton_frobenius_algebra.py      | The charged leptons as an étale Frobenius algebra over the $\mu_6$ resolvent. [E] exact coefficients $(c_e, c_\mu, c_\tau)=(\frac{16}{7}, \frac{4}{3}, \frac{7}{6})$ , ring closure $c_e c_\tau = \frac{8}{3} =  \mathbb{Z}_2  c_\mu$ , product $\frac{32}{9} = 2^{g_{\text{car}}} / N_{\text{fam}}^2$ . [E] $A=\mathbb{Q}[t]/(m)$ , $m=\prod(t-c)$ : the trace-form Gram is nondegenerate ( $\det=\text{disc}(m)\neq 0$ , $A$ étale) — a commutative Frobenius algebra; the $C_6$ shift has characteristic polynomial $t^6-1$ (spectrum $\mu_6=\mu_3$ family $\times \mu_2$ sheet). [C] the PMNS extension via $\text{Aut}(A)$ and the hexagonal CM point [E][C] |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v230_center_budget_norms.py       | The Sheet-Diamond center budget (7, 11, 13) is the three <i>local norms</i> of the theory. [E] $C=R+Q$ diag(1, 0, 0), row sums (7, 11, 13): $7=N_{\mathbb{Z}[\omega]}(3+2\omega)$ (Eisenstein/hex = scalaron), $13=N_{\mathbb{Z}[i]}(3+2i)$ (Gauss/square = $\Delta_Q$ ), $11=\binom{4}{0}+\binom{4}{1}+\binom{4}{2}=1+4+6$ (QBL boundary Fock count on the 4 $\mu_4$ corners = $\dim S^+ - g_{\text{car}}=16-5$ ). The two CM rings (v222) and the seam boundary count meet in one operator center; the reading is [C][E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v231_cp_mu6_phases.py             | Both CP phases are $\mu_6$ powers of <i>one</i> hexagonal CM unit, split by the sheet — a structural reduction of red-team Target D (sharper than v220/v225). With $\rho=e^{i\pi/3}$ (the $j=0$ Eisenstein CM unit): [E] $\rho$ is a primitive 6th root ( $\rho^6=1$ , $\rho^3=-1$ the $\mathbb{Z}_2$ sheet half-turn); [E] $\delta_{\text{CKM}}$ leading = $\arg(\rho^1)=\pi/3$ (quark), $\delta_{\text{PMNS}} = \arg(\rho^4)=4\pi/3$ (lepton, the <i>phase lattice</i> ); [E] $\rho^4=-\rho \Rightarrow \delta_{\text{PMNS}}=\delta_{\text{CKM,lead}}+\pi=(\text{CM unit})\times(\mathbb{Z}_2 \text{ sheet})$ — the two CP phases are <i>one</i> hexagonal unit on the two sheets, not two independent inputs; [E] the $C_6/\mu_6$ monodromy has charpoly $t^6-1$ (spectrum $\mu_6$ carries $\rho$ ); [E] orientation $\text{Im det}(\mathbf{1}, d, \rho^1 n)=+21 \sin(\pi/3)$ , $\text{Im det}(\mathbf{1}, d, \rho^4 n)=-21 \sin(\pi/3)$ (sheet-flipped Jarlskog, v225); [E] NEG $\mu_3$ has no $-1$ (no sheet; $\mu_6=\mu_3$ family $\times \mu_2$ sheet). REDUCTION: 2 CP phase inputs $\rightarrow$ 1 hexagonal unit + the sheet; the physical CP derivation stays [C], the deck stays $\mathbb{Z}/4$ (v215) [E][C]                                                                                                                                                                               |
| v232_e8_kleinian_seam.py          | The seam as the $E_8$ <i>Kleinian singularity</i> — a canonical algebraic-geometric model for the open seam-realisation premise QGEO.REALIZE.01 (the du Val side of the McKay correspondence, v219). [E] the McKay graph of $2I$ is affine $E_8$ ; dropping the unique trivial-rep node (the single Kac mark 1) leaves the <i>finite</i> $E_8$ Dynkin on 8 nodes = the dual intersection graph of the eight exceptional $\mathbb{P}^1$ 's of the minimal resolution of $\mathbb{C}^2/2I$ (trivalent node, arms 1, 2, 4). [E] eight exceptional $\mathbb{P}^1$ 's = $\text{rank } E_8 = g_{\text{car}} + N_{\text{fam}} = \#$ nontrivial $2I$ irreps — a fourth reading of the 8 in $c_3=1/(8\pi)$ . [E] the negated intersection form is the $E_8$ Cartan (even, $\det=1$ , positive definite; each $\mathbb{P}^1$ a $(-2)$ -curve). [E] one degree-1 irrep $\Rightarrow 2I$ perfect $\Rightarrow H_1(S^3/2I)=0$ : the link is the Poincaré homology 3-sphere, $\pi_1=2I$ of order $120= R^+(E_8) $ . [C] seam reading: the raw RP seam ( $\mathbb{P}^1$ with marks) is canonically a du Val exceptional curve — a model for QGEO.REALIZE.01, not a P2 proof (presupposes $E_8$ ); bedrock [O][E][C][O]                                                                                                                                                                                                 |
| v233_cp_triality_phase.py         | The CP phase is the <i>universal</i> family/triality phase, only sheet-split — one step past v231 in $\mu_6=\mu_3$ (family/triality) $\times \mu_2$ (sheet). [E] $\mu_6=\mu_3 \times \mu_2$ : the $\mathbb{Z}_3$ triality centre $\{1, \omega, \omega^2\}$ = the cusp weights $\{0, \frac{1}{3}, \frac{2}{3}\} \times 2\pi$ , the sheet $\mu_2=\{1, -1\}$ ; $\rho=\omega^2 \cdot (-1)$ . [E] SAME FAMILY CLASS: $\rho^4=\rho^1 \cdot \rho^3$ with $\rho^3 \in \mu_2$ , so the quark ( $\rho^1$ ) and lepton ( $\rho^4$ ) CP phases have the <i>same</i> image in $\mu_6/\mu_2 \cong \mu_3$ and <i>opposite</i> sheet — the CP phase <i>is</i> the universal triality phase $\omega^2$ (the $2/3$ cusp-weight $\mathbb{Z}_3$ centre), not a free power choice. [E] $\omega$ is the $\mu_3$ factor of the order-30 (2, 3, 5) Milnor/Coxeter monodromy that builds $E_8$ (v232). Reduces Target D from ‘one hexagonal unit + sheet’ (v231) to ‘the universal triality phase + sheet’; the physical CP derivation stays [C][E][C]                                                                                                                                                                                                                                                                                                                                                                           |
| v234_seam_holomorphy_selection.py | The Seam-Holomorphy selection certificate: the entire structural residual is <i>one</i> condition with <i>three</i> equivalent faces, all forcing $E_8$ . The condition: <i>the seam carries no nontrivial abelian sector</i> . [E] (i) AQFT — the boundary net is holomorphic ( $\mu$ -index 1); (ii) geometry — the seam link is a homology 3-sphere $\Leftrightarrow$ the binary group is perfect $\Leftrightarrow 2I$ ; (iii) rep theory — exactly one 1-dim irrep. [E] $\#(\text{mark-1 affine nodes}) =  \Gamma^{\text{ab}}  =  H_1(S^3/\Gamma)  = \#(1\text{-dim irreps})$ : $A_n \rightarrow n+1$ , $D_n \rightarrow 4$ , $E_6 \rightarrow 3$ , $E_7 \rightarrow 2$ , $E_8 \rightarrow 1$ — only $E_8$ gives 1 ( $2I$ the unique perfect $SU(2)$ subgroup, Poincaré the unique homology-sphere space form). [E] holomorphic $c=8=g_{\text{car}}+N_{\text{fam}} \Rightarrow$ the unique even unimodular rank-8 lattice = $E_8$ . [E] the three faces (v83/v154, v232, v219) are the SAME $E_8$ -selector, so Target A, $G_{\text{net}}$ , the carrier P2 and the Kleinian seam are <i>one</i> gate. [O] the closing theorem (stated): $\text{RP}+\text{gap}+\text{chirality} \Rightarrow$ quasi-free bulk (v160) $\Rightarrow$ invertible bulk $\Rightarrow$ holomorphic boundary $\Rightarrow E_8$ ; the single residual analytic step is ‘free bulk $\Rightarrow$ holomorphic boundary’ [E][O] |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v235_seam_chern_simons.py         | The closing step in abelian Chern–Simons language: holomorphic $\Leftrightarrow \det K=1$ — a genuine reduction (not a closure) of GATE.HOLO.01 into standard anyon-condensation physics. [E] a free gapped bosonic 2+1d bulk = an even integer $K$ -matrix with $\# \text{anyons} =  \det K $ , edge $c = \text{signature}(K)$ , holomorphic $\Leftrightarrow  \det K =1$ . The TFPT extension tower (v92) is the condensation tower read by determinant: carrier $D_5 \oplus A_3$ ( $\det 16$ , 16 anyons) $\rightarrow SO(16)_1 = D_8$ ( $\det 4$ ) $\rightarrow (E_8)_1$ ( $\det 1$ , holomorphic), all rank 8, $c = \text{sig}=8=g_{\text{car}}+N_{\text{fam}}$ . [E] holomorphic $\Leftrightarrow \det 1 \Leftrightarrow E_8$ = the Kitaev $E_8$ quantum-Hall state. [E] condensation: a Lagrangian glue of order $\sqrt{16}= \mu_4 =4$ takes $\det 16 \rightarrow 1$ (a partial order-2 isotropic only $\rightarrow 4=D_8$ ). [E] NEG: $D_8$ is free+bosonic but has 4 anyons; an odd $K$ is fermionic — $\det=1$ is the extra condition. [O] residual: ‘the free RP seam condenses the order- $ \mu_4 $ Lagrangian glue’ = the sheet/QGEO selection, now with holomorphy $\Leftrightarrow \det 1$ a theorem [E][O]                                  |
| v236_brieskorn_capstone.py        | The $(2, 3, 5)$ Brieskorn singularity $x^2+y^3+z^5$ is the <i>one</i> generator of the discrete skeleton — the capstone of the icosahedral round (v55/v219/v223/v232/v233); its exponents <i>are</i> the atoms $( \mathbb{Z}_2 , N_{\text{fam}}, g_{\text{car}})=(2, 3, 5)$ . [E] Milnor number $\mu=(2-1)(3-1)(5-1)=1\cdot 2\cdot 4=8=\text{rank } E_8$ = the 8 in $c_3=1/(8\pi)$ (a fifth independent origin). [E] the Milnor monodromy eigenvalues are the eight primitive 30th roots $e^{2\pi i m/30}$ , $m$ the $E_8$ exponents (charpoly $\Phi_{30}$ , $\deg \varphi(30)=8=\mu$ ) — so it <i>is</i> the order-30 $E_8$ Coxeter element (v55). [E] both clocks: the monodromy group $\langle h \rangle = \mathbb{Z}/30 = \mathbb{Z}/2 \times \mathbb{Z}/3 \times \mathbb{Z}/5$ carries the $\mu_3$ triality (CP, v233) as $h^{10}$ ; the Galois group $(\mathbb{Z}/30)^\times = \mathbb{Z}/2 \times \mathbb{Z}/4$ carries the $\mu_4$ clock ( $\times 7$ , v223). [E] Milnor lattice = $E_8$ , link = Poincaré sphere. [C] one singularity generates atoms + 8 + $E_8$ + order-30 + both clocks + seam; a unification, not a closure [E][C]                                                                                                            |
| v237_seam_sre_closure.py          | The closing step as a <i>physical</i> condition: no topological ground-state degeneracy $\Leftrightarrow \det K=1 \Leftrightarrow$ the seam bulk is short-range-entangled (SRE/invertible) — sharpening GATE.HOLO.02’s residual from definitional to falsifiable. [E] the $K$ -matrix ground-state degeneracy on a genus- $g$ surface is $ \det K ^g$ (carrier $\rightarrow 16$ , $D_8 \rightarrow 4$ , $E_8 \rightarrow 1$ on the torus), so ‘no degeneracy on any closed surface’ $\Leftrightarrow \det K=1$ . [E] among rank-8 even positive-definite $K$ ( $c=8=g_{\text{car}}+N_{\text{fam}}$ ) only $E_8$ has $\det 1$ — the unique nontrivial bosonic SRE 2+1d phase (Kitaev $E_8$ ), edge holomorphic; $D_8$ /carrier are LRE. [E] a unique vacuum on the plane (RP+gap+cluster) is necessary but not sufficient (the plane cannot see $\det K$ , the torus does), so the residual is ‘the seam unique-vacuum extends to the torus’ = SRE. [E] NEG: an LRE bulk ( $D_8$ ) has 4-fold torus degeneracy + non-holomorphic boundary. [O] sharpened residual: ‘the free RP gapped seam is short-range-entangled (no topological order)’ = $\det K=1$ = the Kitaev $E_8$ phase — a yes/no statement, sharper than v235/QGEO.SYM.01; not a closure [E][O] |
| v238_modular_lindblad_dynamics.py | DYN.SEMIGROUP.01 — the static $\rightarrow$ dynamic flip: the seam’s modular flow (reversible) and its recovery channel as a Markov/Lindblad generator (irreversible), the dissipative gap = the OS mass gap. Companion to v196/v198 (modular) and v221/v64 (recovery), which state the structure <i>statically</i> ; this reads the same objects <i>dynamically</i> . [E] the modular flow $\sigma_t = e^{it\Lambda_\Sigma}$ is a unitary one-parameter group (Tomita–Takesaki) and the $\mu_4$ clock is conserved $\Leftrightarrow [\rho, \Lambda_\Sigma] = 0$ (the v198 state-invariance), so the static commutator is the conservation law of modular time. [E] $L = \log T$ is a doubly-stochastic generator ( $e^L = T$ , $e^{L\tau} \rightarrow$ the democratic projector = the arrow of time, cf. v64). [E] keystone: the dissipative gap = $-\log((2/3)^6) = 6\log(3/2)$ = the OS mass gap $\Delta$ (v64) — the static recovery bound and the dynamical mass gap are one number, one exponentiated. [E] GKSL split (imaginary + $\text{real} \leq 0$ spectrum). [O] geometric modular flow on the full seam algebra (Connes–Rovelli thermal time = QGEO.SYM.01, v198) — a target, not a closure.                                                   |

|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v239_kms_thermal_time.py        | DYN.KMS.01 — KMS / thermal time: the modular flow of v238 makes the seam state a KMS (thermal) state at $\beta = 1$ , and the geometric normalisation fixes the seam temperature via $2\pi = 1/(4c_3)$ . [E] KMS at $\beta = 1$ : $\omega(A\sigma_i(B)) = \omega(BA)$ ( $\omega(X) = \text{Tr}(\rho X)$ , $\rho = e^{-\Lambda_\Sigma}/Z$ ), so modular time (v238) is a thermal time (Connes–Rovelli); NEG $\beta \neq 1$ fails (Tomita–Takesaki pins $\beta = 1$ ). [E] the seam unit $\beta_{\text{phys}} = 2\pi = 1/(4c_3)$ (v58) makes the KMS temperature the horizon temperature $T_H = c_3/M$ (v57/v208). [E] one object with v238. [O] the geometric-boost identification = QGEO.SYM.01 — a target, not a closure.                                                                                                                                                                                                                                                                                                |
| v240_gns_os_reconstruction.py   | DYN.GNS.01 — GNS / OS reconstruction (finite toy): the Hilbert space and a POSITIVE Hamiltonian are OUTPUTS of the seam data $(M, \omega)$ , not inputs. [E] GNS: $\langle A, B \rangle = \text{Tr}(\rho A^\dagger B)$ Hermitian positive-definite ( $\rho > 0$ ), $\dim n^2$ , identity cyclic+separating. [E] modular flow $\sigma_t(x) = \rho^{it} x \rho^{-it}$ is a state-preserving *-automorphism, generator $i[\log \rho, \cdot] = \Lambda_\Sigma$ (v238). [E] OS Hamiltonian $H_{\text{OS}} = -\log T$ (the v221 transfer) is POSITIVE — eigenvalues $\{0, 6\log(3/2), 6\log 3\} \geq 0$ , gap = $6\log(3/2)$ = the v64 mass gap. [E] $H_{\text{OS}} = -L$ : minus the v238 dissipative generator (recovery semigroup = Euclidean time). [O] the geometric/operator-level step = QGEO.SYM.01/BW + the standard OS theorem under RP/gap — a target, not a closure.                                                                                                                                                |
| v241_dhr_sectors.py             | DHR.SECTORS.01 — particles = DHR superselection sectors: the carrier discriminant/anyon content and the v235/v237 condensation tower as an abelian MTC. Carrier form (Lean-verified, FORM.GLUE.01): on $\mathbb{Z}_4 \times \mathbb{Z}_4$ , $q(x, y) = (5x^2 + 3y^2)/8 \bmod 1$ , $\theta(a) = e^{2\pi i q(a)}$ . [E] 16 sectors = $\mathbb{Z}_4 \times \mathbb{Z}_4$ ( $= \det K_{\text{carrier}} = \dim S^+$ ), fusion = abelian group law. [E] condensable $\Leftrightarrow \theta = 1 \Leftrightarrow \text{isotropic} \Leftrightarrow 5x^2 + 3y^2 \equiv 0 \bmod 8$ — the six elements $\{(0, 0), (1, 1), (1, 3), (2, 2), (3, 1), (3, 3)\}$ . [E] tower = v235/v237: Lagrangian $\langle (1, 1) \rangle$ (order 4, self-dual) $\rightarrow 1$ sector = $(E_8)_1$ ; order-2 $\langle (2, 2) \rangle \rightarrow 4 = D_8$ ; carrier $16 \rightarrow D_8 \rightarrow E_8$ . [E] NEG: a non-isotropic anyon $(1, 0)$ is confined. [C] sector $\leftrightarrow$ SM-multiplet map is the interpretation; the MTC is exact. |
| v242_spin_statistics_modular.py | DHR.MODULAR.01 — spin-statistics and the modular $(S, T)$ data of the carrier MTC: statistics + the fusion ring recovered from modular data + the anyon central charge $c = 8$ . Same MTC as v241 ( $\mathbb{Z}_4 \times \mathbb{Z}_4$ , $q = (5x^2 + 3y^2)/8$ , $\theta = e^{2\pi i q}$ ). [E] spin-statistics: $T = \text{diag}(\theta_a) \rightarrow 6$ bosons ( $\theta = 1$ ), 2 fermions ( $\theta = -1$ ) = $\{(0, 2), (2, 0)\}$ , 8 anyons. [E] modular $S_{ab} = (1/\sqrt{16})e^{-2\pi i B(a,b)}$ unitary, symmetric, $S^2 = C$ (charge conjugation), $S^4 = I$ . [E] Verlinde $N_{ab}^c = \sum_x S_{ax} S_{bx} S_{cx}^* / S_{0x} = \delta(c, a+b)$ — fusion recovered from modular data. [E] Gauss–Milgram $(1/\sqrt{16}) \sum \theta_a = e^{2\pi i c/8}$ with $c = 8 = g_{\text{car}} + N_{\text{fam}}$ = the $(E_8)_1$ central charge (v156/v175). [C] the boson/fermion split is the kinematic skeleton; the sector $\leftrightarrow$ multiplet map is the interpretation.                                   |
| v243_haag_ruelle_braiding.py    | DHR.SMATRIX.01 — scattering: the Haag–Ruelle skeleton + the braiding S-matrix. The seam net has a mass gap (v64/v238) so Haag–Ruelle constructs asymptotic states; for the abelian anyon MTC (v241/v242) the 2-particle S-matrix is the monodromy $M(a, b) = \theta(a+b)/(\theta(a)\theta(b)) = e^{2\pi i B(a,b)}$ . [E] mass gap $\Delta = 6\log(3/2) > 0 \rightarrow$ HR in/out states. [E] 2-particle S = monodromy: $ M  = 1$ , diagonal in conserved labels $\rightarrow$ no particle production, factorised (integrable) scattering. [E] Yang–Baxter: $M$ is a bicharacter $\rightarrow$ multi-particle factorisation. [E] crossing+symmetry: $M(a, b) = M(b, a)$ , $M(a, -b) = M(a, b)^*$ . [E] holomorphic point: on the condensed $(E_8)_1$ (single sector) $M = 1$ , trivial braiding ( $\det 1/\text{SRE}$ ). [O] the 4d S-matrix / cross-sections are the open holographic uplift (Phase 3).                                                                                                                  |

*continued on next page*

| Script                              | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v244_spectral_action_contract.py    | <p>CONTRACT.QFT4D.01 — the 4d Lagrangian via Connes' spectral action: the honest contract for the Phase-3 gap (2d seam net <math>\rightarrow</math> 4d physics). A single Dirac operator whose <math>\text{Tr } f(D/\Lambda)</math> yields gravity AND matter. [E] carrier spinor = one generation: <math>SO(10)</math> half-spinor = <math>\dim S^+ = 2^{g_{\text{car}}-1} = 16</math> (<math>15 + \nu_R</math>), <math>N_{\text{fam}} = 3</math>. [E] SM gauge group inside the carrier: <math>SU(3) \times SU(2) \times U(1)</math> (<math>\dim 12</math>) <math>\subset SU(5)</math> (24) <math>\subset SO(10) = D_5</math> (45); colour <math>SU(3) \subset A_3 = SU(4)</math> (Pati-Salam); <math>\text{rank}(D_5) + \text{rank}(A_3) = 8 = \text{rank } E_8</math>. [E] one Dirac operator <math>\rightarrow</math> gravity (<math>a_2 \sim R</math>, <math>a_4 \sim R^2</math>, <math>\sqrt{36}</math>) + matter (<math>a_4 \sim F^2</math> Yang-Mills + <math> D\phi ^2</math> Higgs, Gilkey). [X] hooks: <math>g_3 = g_2 = \sqrt{5/3} g_1</math> + a Higgs-quartic relation. [O] CONTRACT.QFT4D.01: obligations (seam <math>\rightarrow</math> Dirac <math>D</math>; finite geometry = carrier; spectral action reproduces SM couplings) <math>\rightarrow</math> the 4d SM+gravity Lagrangian is an OUTPUT — the Phase-3 target, not closed.</p> |
| v245_spectral_matter_content.py     | <p>QFT4D.MATTER.01 — the computable core of CONTRACT.QFT4D.01 (v244): the spectral-action / NCG matter content, discharging the rep-theory + tree-relation core to [E]. The carrier half-spinor is the <math>SO(10)</math> <b>16</b>. [E] <b>16</b> = one generation: <math>SO(10)</math> <b>16</b> = <math>SU(5)(\mathbf{10} + \mathbf{5} + \mathbf{1})</math>; SM dims <math>6 + 3 + 1 + 2 + 3 + 1 = 16 = \dim S^+</math>, <math>N_{\text{fam}} = 3</math> (15 Weyl fermions + <math>\nu_R</math>). [E] electric charges <math>Q = T_3 + Y</math> are exactly the SM values — hypercharges forced by the embedding. [E] anomaly-free: <math>\sum Y = 0</math>, <math>\sum Y^3 = 0</math>, <math>[SU(2)]^2 U(1) = 0</math>, <math>[SU(3)]^2 U(1) = 0</math> (exact). [E] unification: <math>\sin^2 \theta_W = (\sum T_3^2) / (\sum Q^2) = 3/8</math>, i.e. <math>g_3 = g_2 = \sqrt{5/3} g_1</math>. [E] Higgs = the <math>(1, 2)_{1/2}</math> inner fluctuation (one doublet). [O] residual: the seam <math>\rightarrow</math> Dirac realisation + measured-coupling reproduction stay the open contract.</p>                                                                                                                                                                                                                                              |
| v246_unification_data_crosscheck.py | <p>QFT4D.RGTEST.01 — the honest data cross-check for the spectral-action prediction (v244/v245): does <math>g_1 = g_2 = g_3</math>, <math>\sin^2 \theta_W = 3/8</math> at <math>\Lambda</math> survive the <i>measured</i> SM couplings? Not in the plain SM. Inputs (PDG, GUT-normalised, <math>M_Z</math>): <math>\alpha_i^{-1} = (59.01, 29.59, 8.47)</math>, SM 1-loop <math>b = (41/10, -19/6, -7)</math> (v159). [E] the prediction: <math>\alpha_1 = \alpha_2 = \alpha_3</math>, <math>\sin^2 \theta_W = 3/8</math> at <math>\Lambda</math>. [X] tension: pairwise crossings spread <math>\sim 4</math> decades (<math>\sim 10^{13} - 10^{17}</math> GeV), residual spread at <math>2 \times 10^{16}</math> <math>\Delta \alpha^{-1} \sim 8.8</math> — <math>g_1 = g_2 = g_3</math> not realised by the plain SM. [X] <math>\sin^2 \theta_W</math> 3/8 vs measured 0.23122. [X] 2-loop also misses (min spread <math>\sim 3.2</math> at <math>1.7 \times 10^{14}</math> GeV). [O] no rescue: SM gauge content + no new states (the <math>E_8</math> spine is arithmetic, not a threshold tower) <math>\Rightarrow</math> no admissible thresholds; closing it needs new matter (vs 'no new state') or a non-GUT/boundary reading — tension like NCG-SM, likely falsified unless extended. A kill-test, [X]/[O], never [E]-as-success.</p>            |
| v247_e8_branching_no126.py          | <p>PS.E8BRANCH.01 — the <math>E_8</math> audit hull forbids the <b>126</b> and supplies exactly <math>\{1, 10, 16, 45\}</math> for <math>SO(10)</math>. Carrier <math>D_5 \oplus A_3 = SO(10) \times SU(4) \subset E_8</math> (via <math>SO(16)</math>); <b>248</b> = <math>(45, 1) + (1, 15) + (10, 6) + (16, 4) + (\overline{16}, \bar{4}) = 248</math>. [E] ranks <math>5 + 3 = 8</math>; [E] dims = 248 (<math>SO(16)</math>: 120 adj + 128 spinor); [E] <math>SO(10)</math> content <math>\{1, 10, 16, 45\}</math>, the <b>126</b> ABSENT <math>\Rightarrow 126_H</math> algebraically forbidden, <math>10 + 16 + 45</math> <math>E_8</math>-supplied not fitted; [E] caveat only one 45/one 15 <math>\rightarrow</math> proton-marginal; [O] the field-content principle + NCG complement (v250).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| v248_ps_algebra.py                  | <p>PS.ALGEBRA.01 — the Pati-Salam NCG algebra <math>A_F = \mathbb{H}_L \oplus \mathbb{H}_R \oplus M_4(\mathbb{C})</math> and its exact SM matching. [E] unimodular group <math>SU(2)_L \times SU(2)_R \times SU(4)_c</math> (rank 5, <math>\dim 21</math>); [E] <b>16</b> = <math>(4, 2, 1) + (\bar{4}, 1, 2) = 8 + 8</math>; [E] <math>Y = T_{3R} + (B - L)/2</math> gives the exact SM hypercharges and <math>Q = T_{3L} + Y</math> the exact charges; [E] matching <math>\alpha_1^{-1} = \frac{3}{5} \alpha_{2R}^{-1} + \frac{2}{5} \alpha_4^{-1}</math>, <math>\sin^2 \theta_W = 3/8</math>. |-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v250_dirac_triple_contract.py     | CONTRACT.QFT4D.DIRAC.01 — the spectral-triple contract that would make ‘carrier gauged’ a theorem. Target $(A, H, D, J, \gamma)$ almost-commutative, $A_F = \text{PS}$ (v248), $H_F = 3 \times 16$ , $D_F$ from $(R, L, \varphi_0, \text{Majorana})$ . [E] $H_F = 3 \times 16 = 48$ ; [E] the Yukawas are already fixed (v18) so the open test is NCG consistency; [O] the 7 NCG axioms (first-order condition = the historic $SO(10)$ obstruction); [O] $\sigma = \text{scalaron hypothesis}$ (rescues first-order + $\nu_R$ Majorana; $M_{PS} = \kappa M_s$ ) — caveat $\sigma \leftrightarrow \nu_R \nu_R$ not automatic; [O] inner fluctuations $\rightarrow 10+16+45$ not 126. Reduces 4d QFT to one object + finite NCG checks.                                                                                                                                                                             |
| v251_first_order_sigma.py         | PS.DIRAC.01 — the first-order condition is violated <i>exactly</i> by the Majorana/ $\sigma$ term (Chamseddine–Connes–van Suijlekom ‘beyond first order’ $\rightarrow$ Pati–Salam + $\sigma$ ), exhibited on a faithful lepton-block model; advances v250 from contract to mechanism. Honest correction: $\sigma$ does NOT ‘rescue’ first order — one DROPS it and the inner fluctuations generate $\text{PS} + \sigma$ . [E] order-zero; [E] real-even ( $J^2 = +1$ , $\gamma^2 = 1$ , $D\gamma = -\gamma D$ , KO-6 signs); [E] first order HOLDS for the Yukawa block; [E] first order VIOLATED by $M \neq 0$ , supported exactly on the $\nu_R \nu_R^c$ blocks ( $\sigma$ the unique violator). [C] $\sigma = \text{scalaron}$ (v249). [O] the full 96-dim SM/PS triple + spectral action (v250).                                                                                                              |
| v252_full_finite_triple.py        | PS.DIRAC.02 — the full 96-dim finite spectral triple $(A_F, H_F, D_F, J, \gamma)$ built explicitly with the NCG axioms verified; advances v250 from a 7-obligation contract to a concrete object discharging 5 to [E]. $H_F = \text{particle} \oplus \text{antiparticle}$ doubling of three $SO(10)$ <b>16</b> -plets (dim 96). [E] dim 96; $D_F$ Hermitian+odd; reality $J^2 = +1$ , $JD = DJ$ ; grading $\gamma^2 = 1$ , $[\gamma, a] = 0$ , $J\gamma = -\gamma J$ ; KO-dim 6; order-zero; first order HOLDS for the SM $\mathbb{C} \oplus \mathbb{H} \oplus M_3$ (incl. Majorana) and VIOLATED for Pati–Salam exactly by the Majorana on $\{\nu_R, e_R\}$ (CCvS beyond-first-order $\rightarrow \text{PS} + \sigma$ ); spectrum = fermion masses + seesaw $m_{\text{light}} = m_D^2 / M_R$ . [C] Poincaré duality (intersection form non-degenerate). [O] orientability + no-junk + spectral-action expansion. |
| v253_kappa_scalaron_ps.py         | PS.KAPPA.01 — pinning $\kappa$ in $M_{PS} = \kappa M_s$ , discharging residual 6(b) of v249. $M_s = c_3^{7/2} \bar{M} \approx 3.06 \times 10^{13} \text{ GeV}$ (exact). [E] scalaron scale exact; [E] $\kappa$ pinned by RG (scan PDG errors $\times$ the two $E_8$ -allowed contents) to a tight $O(1)$ interval $\sim 1.3$ (1-loop $[1.0, 1.7]$ , 2-loop $[1.0, 1.2]$ ) — pinned, not free. [C] heat-kernel origin $\kappa = \sqrt{(f_2/f_0)} c_{PS}/c_{\text{grav}}$ , a ratio of heat-kernel traces over the 96-dim $H_F$ (v252) — $\Lambda$ cancels, $\kappa$ scale-free and $O(1)$ . [X] the <b>126</b> -content drives $\kappa$ out of the $O(1)$ window (content-selective). [O] the exact decimal needs the cutoff moments $f_2/f_0$ fixed.                                                                                                                                                              |
| v254_inner_fluctuations.py        | PS.NCG.FLUCT.01 — the inner fluctuations $\Omega_D^1(A_F)$ of the finite Dirac operator computed explicitly (reuses the v252 triple); closes v250 #5 (Higgs content, not <b>126</b> ) + the no-junk obligation + the $\sigma$ quantum numbers. [E] $\Omega_{D_F}^1$ purely chirality-odd $\rightarrow$ finite fluctuations are scalars; [E] no junk / no <b>126</b> : SM-algebra 1-forms sit exactly in the Higgs-doublet pattern (the single $(1, 2)_{1/2}$ ); [E] the $\sigma$ ( $\nu_R$ Majorana) direction is absent for the SM algebra but present for Pati–Salam — $\sigma$ is the CCvS beyond-first-order scalar; [E] $\sigma$ is an SM singlet $(1, 1, 0)$ with $B-L = 2$ ; [C] $\sigma = \text{scalaron consistency}$ .                                                                                                                                                                                  |
| v255_spectral_action_expansion.py | PS.SPECACT.01 — the spectral-action heat-kernel (Seeley–DeWitt) expansion $S = 2f_4 \Lambda^4 a_0 + 2f_2 \Lambda^2 a_2 + f_0 a_4$ over the finite triple; closes v252 #11 (spectral-action expansion) and makes $\kappa(f_2/f_0)$ explicit. [E] expansion structure ( $a_0$ cosmological, $a_2$ Einstein–Hilbert+Higgs-mass, $a_4$ Yang–Mills+Weyl <sup>2</sup> + $R^2$ +Higgs-quartic, $N=96$ ); [E] trace inputs $b/a^2 = 1/3$ (top-dominated, Chamseddine–Connes); [E] $\sin^2 \theta_W = 3/8$ (cross-check v245); [C] Higgs quartic $\lambda(\Lambda) \sim g^2 b/a^2 \rightarrow \sim 125 \text{ GeV}$ with $\sigma$ ; [E] scalaron = $R^2$ spin-0 mode (gravitational $a_4 \sim f_0 N$ ); [C] $\kappa = \sqrt{(f_2/f_0)} c_{PS}/c_{\text{grav}}$ explicit; [O] exact decimal needs the cutoff moments fixed.                                                                                                 |

*continued on next page*

| Script                                     | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v256_orientability_<br>poincare.py         | PS.NCG.ORIENT.01 — orientability and Poincaré duality treated honestly (no faked proof). KO-dim 6 forces the intersection form $\text{cap}(p, q) = \text{Tr}(\gamma \pi(p) J \pi(q) J^{-1})$ to be antisymmetric. [E] skew form forced by $J\gamma = -\gamma J + \text{order-zero} + \text{reality}$ (verified); [E] on the SM K-theory $\mathbb{Z}^3$ the skew form has rank 2, corank 1, null $\sim (1, 1, -1)$ — the structural obstruction; [E] orientability local condition $[\gamma_F, \pi(a)] = 0$ , full orientability is a degree-4 cycle on $M \times F$ ; [C] the canonical hypercharge-faithful SM/PS triple satisfies both (van Suijlekom; CCM) — literature; [O] a self-contained machine proof needs the complete canonical bimodule.                                                                                                                                                                                                                                                                                                                                                                                            |
| v257_quasiorient_<br>modpd.py              | PS.NCG.ORIENT.02 — the honest, literature-confirmed resolution of orientability + Poincaré duality, correcting the too-generous v256 typing. Published result (Cacic–Stephan arXiv:0902.2068; CCM07; SM-vacuum hep-th/0601192): the CCM SM finite triple (KO-6, $3\nu_R$ ) genuinely FAILS strict orientability and strict Poincaré duality, satisfying the weakened versions. [E] strict orientability fails ( $\gamma \notin \text{span}\{\lambda(a)\rho(b)\}$ ); [E] quasi-orientability holds (left/right $A$ -irrep boxes disjoint by chirality: $L = H$ doublet, $R = \mathbb{C}$ singlet $\Rightarrow L^{\text{LR}}(\text{even, odd}) = \{0\}$ ); [E] strict Poincaré fails (KO-6 skew form, corank 1, the equal- $L/R$ -neutrino case); [C] modified Poincaré duality (CCM) / Stephan’s PD-restoring triple. A known model-class feature, not a TFPT defect — no faked closure.                                                                                                                                                                                                                                                          |
| v258_dirac_<br>covariance_<br>induction.py | PS.DIRAC.03 — $D_F$ is the modular/covariance <i>induction</i> of the boundary seam state, not an independent posit; closes the ‘posited Yukawa vs derived operator’ gap of v250/v252 (Q2: Dirac as Kasparov product + covariance formula). Quasi-free/modular dictionary: a Gaussian state is fixed by its covariance $C$ (contraction, $\text{spec} \subset (0, 1)$ ) with one-particle modular Hamiltonian $H = \log((1-C)C^{-1})$ (Araki; Casini–Huerta), inverse to the KMS occupation $C = (1+e^H)^{-1}$ ( $\beta=1$ , v239). [E] inversion identity $\log((1-C)C^{-1}) = H$ exactly (random Hermitian + a chirality-graded Yukawa block); [E] $C_F = (1+e^{D/\mu})^{-1}$ a positive contraction; [E] chirality-odd ( $D_F^{\text{ind}}\gamma = -\gamma D_F^{\text{ind}}$ ); [E] unitarily equivalent to v252 (inducing $C_F$ from the 9 Yukawas returns the same spectrum); [E] Majorana = off-diagonal covariance (seesaw $m_{\text{light}} = m_D^2/M_R$ ); [C] $C_F = P_F C_\Sigma P_F$ , so $D_F$ is the KK shadow $[D_\Sigma] \hat{\otimes}_{(E_8)_1} [\mathcal{K}_{\text{car}}]$ and the v18 Yukawas are the readout of $C_\Sigma$ . |
| v259_modular_<br>cutoff_kappa.py           | PS.SPECACT.02 — the spectral-action cutoff <i>is</i> the seam KMS weight, fixing $f_2/f_0=1$ exactly and reducing the last open scheme freedom (v253 #5, v255 #7) from a free function to a finite-triple trace ratio (Q4: the cutoff is modular, not chosen). By Tomita–Takesaki/BW the seam state is KMS at $\beta=1$ (v239) and $2\pi=1/(4c_3)$ (v58) fixes $\beta$ , so the heat-kernel cutoff $f(u)=e^{-u}$ is <i>derived</i> . [E] KMS cutoff moments $f_0=f(0)=1$ , $f_2=\int f=1$ , $f_4=\int u f=1$ , so $f_2/f_0=f_4/f_2=1$ ; [E] seam-fixed $\beta=1$ (no new parameter beyond $c_3$ ); [E] non-vacuous neg control: a Gaussian cutoff $e^{-u^2}$ gives $f_2/f_0=\sqrt{\pi}/2 \neq 1$ ; [E] $\kappa=\sqrt{(f_2/f_0)c_{PS}/c_{\text{grav}}}=\sqrt{c_{PS}/c_{\text{grav}}}$ , no cutoff function left; [C] the RG $\kappa\sim 1.3$ pins $c_{PS}/c_{\text{grav}}\sim 1.7$ ( $O(1)$ ); the [O] free scheme becomes a [C] finite computation over the built triple; [C] the same logic fixes $\lambda(\Lambda)$ .                                                                                                                          |

|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v264_raw_seam_<br>marklocal.py          | QGEO.ENERGY.03 — the raw-seam $\Rightarrow$ mark-locality <i>reduction</i> (not a closure of QGEO.SYM.01). Composing v216+v201+v198 on the canonical pillowcase: [E] Gauss–Bonnet 4 cone points (deficit $\pi$ each, sum $4\pi=2\pi\chi(S^2)$ ), curvature <i>only</i> at the 4 marks; [E] the curvature sourced at the $\mu_4$ orbit $\{0, \pi/2, \pi, 3\pi/2\}$ has Fourier support <i>only</i> on $4\mathbb{Z}$ (FFT), so mark-locality is automatic for the pillowcase; [E] $M_f$ then commutes with the clock $\rho=\text{diag}(i^n)$ ; [E] with $ k $ already commuting (v198), $[\rho, \Lambda]=0 \Rightarrow \omega \circ \rho = \omega$ on this metric; [O] the residual <i>is</i> the metric — the chain assumes the raw seam carries the uniformising flat pillowcase metric (=QGEO.SYM.01), the negative control (curvature off the $\mu_4$ orbit) breaks it. A reduction/sharpening, not a closure.                                                                                                                                                                                                                                                                                                                                                         |
| v265_qft4d_fork_<br>freeze.py           | QFT4D.FORK.01 — freeze the 4D-QFT fork as a <i>branch policy</i> (not an open ambiguity); writes <code>qft4d_fork_freeze.json</code> + a prose guard, no new physics. [C] A: boundary-only is the canonical 4D reading (no 4D-GUT claim by default); [X] SM-only 4D-GUT unification is killed (1-loop spread $\sim 8.8$ at $2 \times 10^{16}$ , v246); [C]/[O] B: carrier-native Pati–Salam is a falsifiable UV branch ( $E_8$ content $\{1, 10, 16, 45\}$ no <b>126</b> v247, $\sin^2 \theta_W = 3/8$ v248, $\kappa O(1)$ band v249/v253, threshold + proton kill test); [X] proton safety rule (no fake $\tau_p$ window); [E] wording guard (bare 4D over-claims absent, scoped policy phrases present). A frozen decision tree, not an open ambiguity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| v266_ps_threshold_<br>proton.py         | PS.PROTON.02 — the explicit Pati–Salam threshold model + proton-decay window that DECIDES branch B of the v265 fork; writes <code>ps_threshold_proton.json</code> . Two-step PS solve + $d=6$ $\tau_p(p \rightarrow e^+ \pi^0)$ : the carrier-native PS UV branch survives proton decay <i>only</i> with the $E_8$ -allowed $(15, 1, 1)$ [the single 45]. [E] explicit thresholds: minimal $16H \rightarrow M_{GUT} \sim 2.4 \times 10^{15}$ , $+(15, 1, 1) \rightarrow M_{GUT} \sim 5.9 \times 10^{15}$ ; [X] minimal KILLED ( $\tau_p \sim 4.4 \times 10^{33}$ yr < Super-K $2.4 \times 10^{34}$ , even high-band); [C] $+(15, 1, 1)$ survives now ( $\tau_p \sim 1.6 \times 10^{35}$ yr); [X] <i>Hyper-K decisive</i> ( $\tau_p$ at the $\sim 1.4 \times 10^{35}$ yr reach) — a dated kill test within the decade; [O] marginal (only one 45 in the hull, v247) + $O(3)$ hadronic uncertainty. A (boundary-only) stays canonical.                                                                                                                                                                                                                                                                                                                                     |
| v267_qgeo_rigidity_<br>minimal_axiom.py | QGEO.SYM.02 — the rigidity / minimal-axiom form of the bedrock QGEO.SYM.01: the ONE bare statement (the raw RP seam admits the carrier $\mu_4$ clock as a conformal symmetry permuting its 4 marks, $= \omega \circ \rho = \omega$ ) <i>forces</i> everything downstream; it does <i>not</i> close the axiom. [E] an order-4 Möbius orbit $\{a, ia, -a, -ia\}$ has cross-ratio 2 (independent of $a$ ); [E] cross-ratio $2 \Leftrightarrow j=1728$ (only $\lambda \in \{-1, \frac{1}{2}, 2\}$ ) $\Leftrightarrow$ the order-4 CM automorphism $(x, y) \mapsto (-x, iy)$ on $y^2=x^3-x$ ; [E] downstream forced: square $\Rightarrow$ the unique flat pillowcase (Trojanov, v214) $\Rightarrow$ curvature at the 4 marks $\Rightarrow \mathbb{Z}_4$ -Fourier DtN (v201/v264) $\Rightarrow [\rho, \Lambda]=0 \Rightarrow \omega \circ \rho = \omega$ (v198); [E] neg controls (generic $j \neq 1728$ , only $\mathbb{Z}_2$ ; hexagonal $j=0$ has $\mathbb{Z}_6$ , order $6 \neq 4$ ); [C] arithmetic rigidity ( $\{1, i, -1, -i\}$ over $\mathbb{Q}$ , $j=1728$ CM by $\mathbb{Z}[i]$ , Belyi/dessins); [O] the bare order-4 symmetry stays the one foundational postulate (like $c=\text{const}$ ). Closes the reduction (axiom $\Rightarrow$ everything), not the axiom. |
| v268_theta13_<br>carrier_trace.py       | FLAV.TH13.01 — the reactor angle $\theta_{13}$ <i>exponent</i> is the carrier hypercharge trace. The value $\sin^2 \theta_{13} = \varphi_0^{\text{ret}} e^{-5/6} = 0.0231$ was already checked (v16); here the exponent origin is closed exactly: [E] $\gamma = \text{tr}_E Y^2 = 3(1/3)^2 + 2(1/2)^2 = 5/6$ over the 5-slot carrier hypercharge $Y = \text{diag}(-\frac{1}{3}, -\frac{1}{3}, -\frac{1}{3}, \frac{1}{2}, \frac{1}{2})$ (roots of $6Y^2 - Y - 1 = 0$ ), complement $1/6$ the neutrino ratio; [C] value 0.02311 vs PDG $\sim 0.0222$ ; [E] own channel — the $\mu\tau$ -breaking $\varepsilon = 3\varphi_0^{\text{ret}}/4$ induces only $\sim 1.6 \times 10^{-3} \ll 0.023$ , so $\theta_{13}$ is a separate carrier-trace channel, not the seesaw $\mu\tau$ breaking (corrects the tempting ‘ $\theta_{13}$ from $M_\nu$ ’ route); [O] CP magnitude + absolute $\nu$ scale remain open.                                                                                                                                                                                                                                                                                                                                                                   |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v269_spert_paqft_skeleton.py   | QFT4D.SPERT.01 — the perturbative 4D S-matrix ( $S_{\text{pert}}$ ) as an Epstein–Glaser / pAQFT skeleton: the honest middle layer of the three-layer S-matrix ( $S_{\text{top}}$ 2d DHR braiding v243 / $S_{\text{pert}}$ 4d EG of the spectral action / $S_{\text{phys}}$ LSZ on the OS Wightman functions v240), <i>not</i> a nonperturbative closure. [E] three distinct layers (the 2d braiding $ M =1$ is statistics, not 4d cross-sections); [E] every spectral-action $a_4$ operator has mass dimension $\leq 4$ in 4D (power-counting renormalizable); [E] a finite counterterm basis (7 marginal +3 relevant, no infinite tower); [C] Epstein–Glaser existence — a renormalizable interaction has an order-by-order $S(g)=T \exp(i \int g L_{\text{int}})$ by causal factorisation + finite local extension (no path integral, no UV divergences); [C] adiabatic limit/gap ( $\Delta=6 \log(3/2)>0$ ) $\rightarrow S_{\text{phys}}$ via LSZ; [O] perturbative only — the ambient measure QG.AMB.01 stays open. A contract/skeleton, explicitly perturbative.                                                                                                            |
| v270_pmns_jarlskog_assembly.py | FLAV.PMNS.03 — the complete complex PMNS matrix + the leptonic Jarlskog $J_{\text{PMNS}}$ (the CP <i>strength</i> ), assembled from the four TFPT channels ( $\sin^2 \theta_{12}=\frac{1}{3}-\frac{\phi_0}{2}$ , $\sin^2 \theta_{23}=\frac{1}{2}$ , $\sin^2 \theta_{13}=\phi_0 e^{-5/6}$ , $\delta=4\pi/3$ ) into one unitary object. [E] the three angle channels; [E] $U = R_{23}U_{13}(\delta)R_{12}$ is exactly unitary; [C] $J_{\text{PMNS}} = \Im(U_{e1}U_{\mu 2}U_{e2}^*U_{\mu 1}^*) = -0.02965$ (formula and full matrix agree), $J_{\text{max}} = 0.03424$ — a <i>derived</i> CP strength, the leptonic analogue of the CKM $J$ (v88); [C] data: $J_{\text{max}}$ vs NuFIT 0.0332 ( $\sim 3\%$ ), $J$ vs best fit $-0.026$ , the negative sign reproduced; [O] $\delta$ is the $\mu_6$ /triality phase (assembled input, <i>not</i> from $M_\nu/D_F$ ) and the absolute $\nu$ -mass scale ( $\Sigma m_\nu$ , $M_R$ ) stays open. Assembles the PMNS matrix + CP strength; does not derive $\delta$ from $D_F$ nor fix the scale.                                                                                                                                         |
| v271_eg_oneloop_quartic.py     | QFT4D.SPERT.02 — a concrete Epstein–Glaser order-2 (one-loop) quartic renormalization, taking the v269 $S_{\text{pert}}$ skeleton from <i>exists</i> to an actual EG number (no path integral). [E] $T_1=:L_{\text{int}}$ : needs no extension, the first extension is $T_2$ ; [E] the massless propagator has scaling degree $\text{sd}=2$ in $d=4$ , the one-loop bubble (two propagators) has $\text{sd}=4=d$ so the UV singular order $\omega=\text{sd}-d=0$ ; [E] $\omega=0 \Rightarrow$ exactly one logarithmic local counterterm ( $C(\omega+d,d)=1$ , renormalizable, no infinite tower); [E] the loop factor $\Omega_3/(2(2\pi)^4)=1/(16\pi^2)$ exactly — the same factor that normalises the spectral-action $a_4$ geometric quartic; [C] the $\phi^4$ one-loop $\beta_\lambda=3\lambda^2/(16\pi^2)$ (symmetry factor 3 = the $s, t, u$ channels), EG initial condition $\lambda_\Phi(\text{UV})=1/(16\pi^2)$ ; [O] order-2/one-loop only — the all-order EG construction and the nonperturbative measure QG.AMB.01 stay open. Turns the skeleton into a concrete one-loop number.                                                                                      |
| v272_nu_mass_scale.py          | FLAV.NUSCALE.01 — the absolute neutrino-mass scale, typed honestly (it does <i>not</i> fabricate a $\Sigma m_\nu$ number, which would contradict the v184 firewall). [E] the absolute scale reduces to <i>one</i> seesaw ratio $m_3 = (y_\nu v_{\text{EW}})^2/M_R$ — one irreducible UV input like $v_{\text{geo}}$ (v153), while the ratios ( $m_2/m_3$ , ordering, PMNS angles v270) are pinned; [C] the observed $m_3=0.050$ eV with the TFPT PS $\rightarrow$ GUT window $M_R \in [4.2 \times 10^{13}, 2.4 \times 10^{15}]$ GeV (v249) needs a third-generation Dirac Yukawa $y_\nu \in [0.26, 2.0]$ — $O(1)$ , no tuning; [O] $M_R(y=1)=6.1 \times 10^{14}$ has $\log_{c_3}(M_R/M_{\text{Pl}})=2.57$ (non-integer), not a TFPT power, so the absolute value stays open; [C] the normal-ordering floor $\Sigma m_\nu=0.0586$ eV is consistent with cosmology ( $< 0.072$ – $0.12$ eV); [X] a cosmological $\Sigma < 0.0586$ eV excludes the normal-ordered $m_1 \sim 0$ spectrum. Closes the PMNS bookkeeping (the last [O] is one seesaw ratio), not the absolute number; sharpened by v481 (carrier normalisation $y_\nu=y_t$ : one-parameter, window-bracketed candidate). |

| Script                              | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v273_eg_gauge_running.py            | QFT4D.SPERT.03 — the gauge sector of the Epstein–Glaser one-loop (v271’s quartic mechanism applied to the gauge self-energy). [E] the one-loop gauge 2-point has scaling degree $sd=4=d$ so $\omega=0 \rightarrow$ one counterterm per coupling (same marginal mechanism + loop factor $1/(16\pi^2)$ as v271); [E] the one-loop $b_i$ from the explicit carrier/SM content: $b_3=-7$ , $b_2=-19/6$ , $b_1=41/10$ (the same 41 as the carrier algebra, v159/CAR.SM.01); [C] physical RG directions $b_3<0$ (asymptotic freedom), $b_1>0$ (U(1) Landau); [O] the two-loop matrix (v159, PyR@TE) + all-order stay open. Shows the gauge running is an EG order-2 result. Exact $b_i$ mirrored in Wolfram.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| v274_scale_overdetermination.py     | SCALE.OVERDET.01 — the single mass anchor is <i>over-determined</i> , and the absence of a derivable absolute scale is a <i>theorem</i> . [E] one anchor (No-Unit, v153): every dimensionful output = pure number $\times M_{P1}^d$ ( $\rho_\Lambda/M_{P1}^4$ , $M_{scal}/M_{P1}=c_3^{7/2}$ , the spectrum); [C] two independent routes to $M_{P1}$ agree: gravity $(8\pi G)^{-1/2}=2.4353\times 10^{18}$ GeV and cosmology (invert $\rho_\Lambda/M_{P1}^4=(3/4\pi^2)e^{-2\alpha^{-1}}$ with $\rho_\Lambda^{1/4}=2.24$ meV) $=2.438\times 10^{18}$ GeV, to 0.11%; [E] the anchor is the gravitational unit ( $G$ ), the one measured dimensionful input of all physics; [E] theorem not gap: the seam is a conformal $c=8$ CFT (v157/v158), scale-invariant by construction $\rightarrow$ no intrinsic scale; [O]/[E] scale-complete up to one over-determined anchor = maximal predictivity. Sharpens v153/v78.                                                                                                                                                                                                                                                          |
| v275_qgamb_roadmap.py               | QGAMB.ROADMAP.01 — the obligation roadmap for QG.AMB.01 (the ambient nonperturbative QG measure), consolidated into one module (the open gate had no script). [E] Tier A gap decoupling: $\Delta_{\text{eff}}=6\log(3/2)-2.248c_3^2=1.648>0$ (v36/v76), so every low-energy readout is independent of the un-built measure — not a blocker; [E] Tier B: the bulk measure reduces to identifying the seam-Calderón boundary with the holomorphic $(E_8)_1$ net ( $c=248/31=8$ ; v77/GATE.METRIC.03), reduced not closed (REDTEAM.A.01); [C] the perturbative layer is in hand (v269/v271/v273); [O] the nonperturbative ambient measure is <i>not</i> constructed — the one genuine structural frontier; [X] closes IFF the seam net $= (E_8)_1$ and the bulk reconstruction is proved. A roadmap, not a closure.                                                                                                                                                                                                                                                                                                                                                          |
| v276_qgeo_flat_closes_commutator.py | QGEO.SYM.03 — the flat $\tau=i$ pillowcase premise <i>closes</i> the modular-commutator chain to all orders, collapsing the bedrock QGEO.SYM.01 to <i>one</i> geometric postulate (it does <i>not</i> prove the premise). For a quasi-free seam state $QGEO.SYM.01 = (\omega \circ \rho = \omega) \Leftrightarrow [\rho, C]=0 \Leftrightarrow [\rho, H]=0$ . [E] isometry $\Rightarrow$ commutator: if $H=f(\Delta_{\text{flat}})$ and the order-4 deck $\rho(z \rightarrow iz)$ is a flat- $\tau=i$ isometry then $[\rho, \Delta]=0 \Rightarrow [\rho, H]=0$ <i>exactly</i> (all orders), verified on the discretised square torus ( $\rho^4=I$ , $[\rho, \Delta]=0$ , $[\rho, \sqrt{-\Delta}]=0$ ; generic non-isometry fails); [E] this upgrades v198 (principal symbol) + v201 (subprincipal) to the full $H$ (flatness removes the curvature terms); [C] $\tau=i$ is forced by order-4 ( $j=1728$ ; hexagonal $j=0$ is order-6, excluded; v214/v267); [O] QGEO.SYM.01 collapses to the single statement ‘the raw seam is the flat $\tau=i$ pillowcase quasi-free state’ — needs a human constructive-QFT proof or stays an honest axiom. Sharpest non-circular form. |
| v277_seam_calderon_e8_match.py      | QGAMB.TIERB.01 — the seam-Calderón $\rightarrow (E_8)_1$ matching certificate, the concrete Tier-B step of QG.AMB.01 (v275): it computes the full $(E_8)_1$ matching target and pins the residual to <i>one</i> bit (it does <i>not</i> close it). [E] $c=8$ (Sugawara, $248/31=g_{\text{car}}+N_{\text{fam}}$ ), but $c=8$ alone does not pin the net; [E] the discriminator is holomorphy — $\det \text{Cartan}(E_8)=1$ (1 primary, holomorphic) vs the $c=8$ counterexample $\det \text{Cartan}(D_8=SO(16))=4$ (4 primaries, non-holomorphic), so the single discriminator is $ \det K =1$ ; [E] the $(E_8)_1$ character $E_4/\eta^8=j^{1/3}=q^{-1/3}(1+248q+\dots)$ has a single primary + exactly $248=\dim E_8$ weight-1 currents (240 roots); [E] equivalence chain holomorphic $\Leftrightarrow \det \text{Cartan} 1 \Leftrightarrow$ unique even unimodular rank-8 (v83) $\Leftrightarrow$ homology-sphere link $\Leftrightarrow  \det K =1$ (v235); [C] seam-side match via v276 (flat $\tau=i$ ) + v260 (Kummer/K3); [O] residual = the single holomorphy bit — reduced to one bit, <i>not</i> closed.                                                         |

| v283_live_killtest_scorecard.py              | PRED.LIVE.01 — a live kill-test scorecard of the recent round’s computable predictions vs current data, each tagged with the decisive experiment. [C] PMNS angles $\sin^2 \theta_{12}=0.30675$ ( $+0.31\sigma$ ), $\sin^2 \theta_{13}=0.02311$ ( $+1.45\sigma$ ), $\theta_{23}$ maximal; [C] leptonic CP $J_{\text{PMNS}}=-0.0297$ , $\delta=240^\circ$ vs $\sim 232(30)$ ; [X] $\Sigma m_\nu$ NO floor 0.0586 eV (DESI/CMB-S4 decisive); [X] proton decay $\tau_p=1.55\times 10^{35}$ yr for $+(15, 1, 1)$ (Hyper-K decisive); [E] closed readouts $\alpha^{-1}$ , $\Omega_b$ , $\beta$ ; all rows consistent $< 2\sigma$ , two sharp near-term kill tests. A consolidation, not new physics.                                                                                                                                                                                                                                                                                                                       |
| v284_route_i_rp_uniqueness.py                | QGEO.ROUTEI.01 — Route (i) (RP-state uniqueness) decomposed into a 6-lemma chain with every dischargeable lemma discharged and the one irreducible lemma isolated (does <i>not</i> prove the open premise). [E] 5/6 lemmas are existing [E]/[O] results — L1 RP→DtN (v194), L2 the four marks force the pillowcase class (v195/v216/v214), L3 the flat orbifold Steklov operator $= \sqrt{-\Delta_{\text{flat}}}$ (verified: flat-strip DtN( $k$ )/ $k \rightarrow 1$ , principal symbol $ \xi $ with no curvature term), L4 covariance $C = (1 + e^H)^{-1}$ from the DtN (v258), L5 $\mu_4$ -invariance (v276/Lean/v280); [C] Troyanov reduction: 4 cone points of angle $\pi \Rightarrow \chi_{\text{orb}} = 0 \Rightarrow$ the unique constant-curvature representative is flat ( $\tau=i$ ), so $L_{\text{open}}$ reduces to ‘the raw seam is the constant-curvature geometric state’; [O] the one open lemma — the raw RP seam state is the constant-curvature/geometric state (the state-identification step). |
| v285_route_ii_seam_condensation.py           | QGAMB.ROUTEII.01 — Route (ii) (seam-net condensation) decomposed into a 4-lemma chain, with the key result that its open lemma <i>coincides</i> with Route (i)’s (the v282 unification at the lemma level). [E] 3/4 lemmas discharged — M1 no abelian sector $\Leftrightarrow  \det K =1 \Leftrightarrow$ holomorphic (v234/v235), M2 holomorphic $c=8 \Leftrightarrow (E_8)_1$ with the $SO(16)$ det-4 counterexample (v277/v281), M3 the condensation tower $16 \rightarrow 4 \rightarrow 1 =$ the unique $\mu_4$ -Lagrangian glue (v92/v281/v235); [E] the discriminator det 1 vs det 4; [E] Routes (i) and (ii) share <i>one</i> open lemma — both say ‘the raw seam is the $(E_8)_1$ -at- $\tau=i$ object’ (v282), so proving either closes both; [O] the unified open lemma: construct a canonical equivalence between the raw seam KMS/DtN state and the holomorphic $(E_8)_1$ net at $\tau=i$ . $M_{\text{open}} = \text{QGEO.SYM.01}$ .                                                                     |
| v286_seam_equivalence_contract.py            | SEAM.EQUIV.01 — the Seam Equivalence contract: concentrates the whole open structure on <i>one</i> named arrow (does <i>not</i> prove it). Theorem: the raw RP seam state reconstructs canonically the holomorphic $(E_8)_1$ boundary net at the $\tau=i$ pillowcase. [E] four objects (RawRPSeam, FlatTauIPillowcaseDtN, HolomorphicE8Net, SREKitaevE8Phase); [E] six arrows — 2 closed (Route i v276/v280/v284, Route ii v281/v277/v235), 1 conditional (v282), 2 open premises (the same lemma, v284/v285), 1 Gral; [E] <b>import firewall</b> : no Route-i module imports any Route-ii module or vice versa, so the routes converge only through SEAM.EQUIV.01 (kills the ‘ $E_8$ into the geometry and back’ circularity); [E] exact-label taxonomy (Formal/Numerical/Conditional Exact, Open Selection); [O] the one open arrow ‘free Gaussian RP bulk $\Rightarrow$ holomorphic single-sector boundary’.                                                                                                      |
| v287_free_rp_bulk_to_holomorphic_boundary.py | SEAM.EQUIV.A01 — Route A (AQFT) theorem-dependency checker for the open Gral arrow ‘free Gaussian RP bulk $\Rightarrow$ holomorphic single-sector boundary net’: types the 5-lemma chain and isolates the <i>one</i> missing standard theorem. [E] L1 RawRPSeam→OS→CAR/quasi-free boundary (v155/v160/v240/v175); [E] L2 gap+chirality $\Rightarrow$ gapped chiral bulk (v64/v156); [O] L3 invertible/SRE Gaussian bulk $\Rightarrow$ single-sector boundary ( $\mu$ -index 1) — the one missing standard theorem (the AQFT form of $\det K=1$ ); [E] L4 $\mu=1+c=8 \Rightarrow$ holomorphic (v234); [E] L5 holomorphic $c=8 \Rightarrow (E_8)_1$ (v83/v277/v281). Verdict: 4/5 discharged, Route A reduces SEAM.EQUIV.01 to one cited theorem.                                                                                                                                                                                                                                                                      |

*continued on next page*

| Script                                | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v288_full_l2_subprincipal_z4.py       | SEAM.EQUIV.B01 — Route B (DtN): the full- $L^2$ lift of the sub-principal $\mathbb{Z}_4$ block-diagonality, proving (numerically, on the full Toeplitz operator) the ‘probably provable’ step and lifting v201/v284 from the finite block to $L^2$ . [E] character orthogonality: a mark-sourced curvature $f = \sum_{j<4} g(\theta - j\pi/2)$ has Fourier support only on $m \equiv 0 \pmod{4}$ ; [E] full- $L^2$ block-diagonality: $\Lambda =  n  + M_f$ commutes with $\rho = \text{diag}(i^n)$ , $\ [\rho, \Lambda]\  \sim 2 \times 10^{-15}$ on $-50..50$ ; [E] negative control: a generic curvature gives $\ [\rho, \Lambda]\  = 4.44 > 0$ ; [E] Lean consistency (geom_sum_fourth_root + markLocal_blockDiagonal); [O] the sharper residual — why is the raw seam sub-principal term mark-local?                                                                |
| v289_marklocal_raw.py                 | MARKLOCAL.RAW.01 — decompose the one remaining Route-B residual (‘why is the raw seam sub-principal term mark-local?’) into a 5-lemma chain and isolate the single open analytic lemma. [C] L1 conic parametrix: conic Steklov DtN $=  D_\theta  + M_f + \text{cone sources}$ (b-calculus/Melrose, imported); [O] L2 <b>Flat-Away</b> — the one open analytic lemma: $\text{RP} + \text{gap} + 4 \text{ marks} \Rightarrow \text{curvature vanishes away from the marks}$ (the flat-pillowcase realisation); [E] L3 orbit-source: the 4 marks form one $\mu_4$ orbit (v195/v216); [E] L4 Fourier-support: $\mu_4$ -orbit curvature $\Rightarrow$ support only on $4\mathbb{Z}$ (v264/v288, with a non-orbit negative control); [E] L5 full-operator: $\Rightarrow [\rho, \Lambda] = 0$ on full $L^2$ (v288). 4/5 discharged; Route B reduces to exactly L2.              |
| v290_z4_smooth_curvature_adversary.py | SEAM.ADVERSARY.01 — the Route-B red-team that $\mathbb{Z}_4$ block-diagonality is <i>not</i> mark-locality. The strongest adversary, a smooth $\mathbb{Z}_4$ -symmetric off-mark curvature $f = \varepsilon \cos(4\theta)$ : [E] it is $\mathbb{Z}_4$ -symmetric (Fourier support $\{\pm 4\} \subset 4\mathbb{Z}$ ) but <i>not</i> mark-local ( $f(\pi/4) = -\varepsilon \neq 0$ ); [E] it <i>passes</i> the v288 commutator $\ [\rho, \Lambda]\  = 0$ (same as mark-local) — so $[\rho, \Lambda] = 0$ is necessary but <i>not</i> sufficient; [E] but it shifts the DtN spectrum off the flat ladder ( $\max  \Delta\lambda  = 0.155$ ) and the heat trace ( $\Delta = 0.019$ ), so the KMS weight and $(E_8)_1$ character shift; [O] a genuine candidate modulus the commutator misses but the spectral data excludes — Flat-Away must use spectral/energy/heat input. |
| v291_flataway_contract.py             | FLATAWAY.RP.01 — the Flat-Away lemma as its own named mini-theorem with three proof routes opened by v290. Lemma [O]: given RawRPSeam with gap, chirality and the four $\mu_4$ marks, the smooth curvature density in the DtN sub-principal symbol vanishes away from the branch divisor. [E] <i>spectral-rigidity</i> : scanning $f = \varepsilon \cos(4\theta)$ , the spectrum deviation from the flat ladder is 0 only at $\varepsilon=0$ — flat is the unique spectral match; [E] <i>heat-kernel</i> : the heat-trace deviation is 0 only at $\varepsilon=0$ ; [C] <i>RP-energy</i> : $\text{RP} + \text{gap}$ is a Dirichlet-energy minimisation in the Troyanov conformal class $\Rightarrow$ constant-curvature minimiser (Troyanov; cf. v284). [O] three independent routes to one lemma; closing any one closes Route B.                                        |
| v292_flataway_heat_reduction.py       | FLATAWAY.HEAT.01 — the Heat-Kernel route made precise: reduces Flat-Away to <i>one</i> named spectral invariant. [E] the heat-trace deviation $\Delta \text{Tr}(e^{-t\Lambda}) = c(t)\varepsilon^2 + O(\varepsilon^4)$ is a positive-definite quadratic form in the off-mark curvature ( $c_k(t) > 0$ for every $\mathbb{Z}_4$ mode $4k$ ; positive on all combinations), so $\Delta \text{Tr} = 0 \Leftrightarrow f = 0$ ; leading invariant $\ f\ _{L^2}$ (Parseval). [O] reduction: Flat-Away $\Leftarrow$ ‘the seam fixes the $a_2$ heat coefficient to its flat value’ $\Rightarrow \int f^2 = 0 \Rightarrow f = 0$ off the marks — one external invariant.                                                                                                                                                                                                         |
| v293_flataway_spectral_hessian.py     | FLATAWAY.SPEC.01 — the Spectral-Rigidity route upgraded from one direction (v291) to the <i>full</i> smooth- $\mathbb{Z}_4$ space. [E] splitting mechanism: the degenerate flat Steklov level $ n $ is split by mode $4k$ at $ n =2k$ by $\pm\varepsilon/2$ ; [E] $S = \sum (\Delta\lambda)^2 \sim 0.50\varepsilon^2$ ; [E] the Hessian over modes $\{4, 8, 12\}$ has eigenvalues $\{0.497, 0.500, 0.503\} > 0$ , so the flat seam is a <i>strict</i> isolated minimum over the whole $\mathbb{Z}_4$ space; [E] a non- $\mathbb{Z}_4$ mode breaks the commutator outright. [O] pinning the seam’s Steklov spectrum excludes every smooth $\mathbb{Z}_4$ deformation $\Rightarrow$ Flat-Away.                                                                                                                                                                             |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v294_flataway_rp_energy.py       | FLATAWAY.ENERGY.01 — the RP-energy / Trojanov route: the flat pillowcase is the unique constant-curvature minimiser at the fixed mark divisor. [E] prescribed divisor + Gauss-Bonnet: $S^2$ with 4 cone angles $\pi$ , $\sum(2\pi - \theta) = 4\pi = 2\pi\chi$ ; [C] Trojanov/Euclidean-cone uniqueness (Trojanov 1991) excludes smooth off-mark curvature; [E] strictly convex curvature energy $E[f] = \int f^2$ , Hessian $2\pi I$ (PD) $\Rightarrow$ unique minimiser; [E] no zero-cost deformation. [O] premise: ‘RP+gap realises the energy-minimiser’, converging with v292/v293 on one selection principle; closing any one closes Route B.                                                                                                                                                                                                                                                                                                                                                                 |
| v295_flataway_a2_exact.py        | FLATAWAY.A2.01 — the <i>exact</i> analytic $a_2$ coefficient, upgrading the v292 positive-definiteness from numerical to a proof. [E] first variation vanishes: $\partial_\varepsilon \text{Tr } e^{-t\Lambda(\varepsilon)} _0 = -t\hat{f}(0) \sum e^{-t n } = 0$ (zero-mean off-mark curvature, Gauss-Bonnet); [E] convexity $\Rightarrow$ global minimum: $\phi(x) = e^{-tx}$ strictly convex $\Rightarrow \Lambda \mapsto \text{Tr } e^{-t\Lambda}$ convex (Klein/Peierls), so $\varepsilon=0$ is the global minimum and $\Delta \text{Tr} \geq 0$ for all $\varepsilon$ , $= 0$ iff $f = 0$ ; [E] exact $a_2$ kernel via the divided difference of $e^{-tx}$ (Duhamel), matched to numerics to rel.err $< 10^{-6}$ ; [E] degenerate-split closed form $2e^{-2kt}(\cosh(tg/2)-1) \geq 0$ ; [O] reduction now analytic: Flat-Away $\Leftarrow$ ‘the seam fixes $a_2$ ’. Lean-mirrored (FORM.FLATAWAY.01).                                                                                                         |
| v296_flataway_a2_closed.py       | FLATAWAY.A2.CLOSED.01 — the exact $a_2$ coefficient in <i>closed form</i> . [E] the operator tails telescope geometrically ( $C_k + D_k e^{-4kt} = 4kt(1 - e^{-4kt})$ ), giving $W_k^{\text{tail}} = t(1 - e^{-4kt})/(8k(1 - e^{-t}))$ ; [E] a finite $(4k-1)$ -term middle (incl. the degenerate diagonal $\Phi(2k, 2k) = (t^2/2)e^{-2kt}$ ); [E] closed form $W_k(t) = \frac{t(1-e^{-4kt})}{8k(1-e^{-t})} + \frac{1}{2} \sum_{m=1}^{4k-1} \Phi(m, 4k-m)$<br>$(W_1(t) = t(2te^t + e^{3t} + 3e^{2t} + e^t - 1)e^{-3t}/8)$ , reproducing v295 to machine precision; [E] manifestly positive; [E] small- $t$ : $W_k = t/2 + O(t^3)$ (mode-independent leading $1/2$ , the $t^2$ term cancels).                                                                                                                                                                                                                                                                                                                        |
| v297_route_a_literature_stack.py | SEAM.EQUIV.A.LIT.01 — Route A’s ‘one standard import’ as a precise citable theorem stack. [E] LIT-A invertible/SRE bulk $\Rightarrow$ trivial bulk topological order (Kitaev 2006; Freed–Hopkins 2021); [E] LIT-B bulk MTC = Drinfeld center, trivial center $\Rightarrow$ holomorphic boundary net (Müger 2003; Kawahigashi–Longo–Müger 2001); [E] LIT-C holomorphic $c=8$ net $\Rightarrow (E_8)_1$ (Conway–Sloane; Dong–Xu/Kawahigashi–Longo). [E] the three compose into ‘invertible bulk $\Rightarrow (E_8)_1$ ’, all legs established; [O] the one open hypothesis is the input of LIT-A, ‘the raw quasi-free seam bulk is invertible (SRE)’ = Route B’s Flat-Away. [E] non-circular with Route B (the v286 firewall holds).                                                                                                                                                                                                                                                                                  |
| v298_e8_network_attractor.py     | <i>E8 as a network attractor</i> — a computational-substrate (Wolfram-program) reading of the $(2, 3, 5)$ /McKay hull, on the v219 bedrock; an honest audit, not a derivation. [E] the $E_8$ Kac marks $(1, 2, 3, 4, 5, 6, 4, 2, 3)$ are the <i>unique</i> attractor of the minimal lazy graph update $m \leftarrow (A + 2I)/4 \cdot m$ on the affine- $E_8/(2, 3, 5)$ McKay graph (converges from any positive start; $Am = 2m$ , top eigenvalue 2). [E] the spherical McKay tower terminates at $E_8$ ( $2T \rightarrow E_6$ , $2O \rightarrow E_7$ , $2I \rightarrow E_8$ , $h = 30$ ); [E] the cascade is nested-subgraph coarse-graining ( $240 \rightarrow 126 \rightarrow 72 \rightarrow 40 \rightarrow 20$ ). [C] Wolfram reading: $E_8$ as the universal attractor of a minimal $(2, 3, 5)$ network (Coxeter-skeleton level). [O] a minimal hypergraph <i>rewrite</i> whose attractor is the full TFPT structure stays open; $\varphi_0 = (4/3)c_3 = 1/(6\pi)$ is the analytic seed, not an edge fraction. |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v299_hypergraph_0d_autonomous.py | The hypergraph/Wolfram bridge (hardened): the 3-arm $(2, 3, \cdot)$ branch type is the irreducible seed on which a local witness-based spectral growth <i>reaches</i> $E_8$ as the last finite point ( $E_6 \rightarrow E_7 \rightarrow E_8$ , then stops at the affine boundary $\hat{E}_8$ ) — <i>not</i> ‘P2 derived’. [E] icosahedron = 3-uniform hypergraph ( $ \text{Aut}  = 120 =  I_h $ ; the McKay group is the $SU(2)$ binary lift $2I$ , a different order-120 group); [E] the $1 \rightarrow 4$ subdivision rewrite is equivariant (120 symmetries at every scale); [E] the $2I$ fusion tensor is a weighted 3-uniform hypergraph whose 2-dim slice is the affine $E_8$ McKay graph; [E] Smith: $\rho \leq 2$ selects (affine) ADE; [E] Collatz–Wielandt: $\rho \leq 2 \Leftrightarrow$ a positive witness $m$ with $Am \leq 2m$ (local); [E] the autonomous rule (diffusion witness + local gate $Am \leq 2m$ ) runs $E_6 \rightarrow E_7 \rightarrow E_8 \rightarrow \hat{E}_8$ under the $(2, 3, \cdot)$ seed; [E] $A_n$ ( $\rho = 2 \cos \frac{\pi}{n+1}$ ) and $D_n$ ( $\rho = 2 \cos \frac{\pi}{2n-2}$ ) controls are $< 2$ for all $n$ , never reaching $E_8$ ; [O] the seed = P2. A second network reading of the $(2, 3, 5)/E_8$ core (v219/v298).                                                   |
| v300_flataway_rigid.py           | FLATAWAY.RIGID.01 — the attack on Flat-Away. [E] the flat fingerprint: $\text{spec}( D_\theta )$ is the integer ladder, every level $n \geq 1$ of multiplicity exactly 2 (a discrete fingerprint, not a norm); [E] the resonant mode $4k$ splits level $2k$ by gap $= g_k$ (sympy $2 \times 2$ $[[2k, g/2], [g/2, 2k]] \Rightarrow 2k \pm g/2$ ), validated vs the full Toeplitz operator; [E] any $g_k \neq 0$ lifts the resonant degeneracy (mult $2 \rightarrow 1+1$ ) and changes the spectral multiset, so preserving the flat ladder <i>with</i> its mult-2 degeneracies forces every $g_k = 0 \Rightarrow f = 0$ — a discrete obstruction, strictly stronger than the v291/v293 ‘deviation grows’ scan; [E] with the v295 convexity, flat is isolated analytically <i>and</i> discretely; [C] the pin derived: the $(E_8)_1$ character $E_4/\eta^8 = q^{-1/3}(1 + 248q + \dots)$ has integer $q$ -coefficients (248 at level 1; $E_8$ even unimodular $\Rightarrow$ integer weights), and by 2d Steklov conformal rigidity the integer ladder $\Leftrightarrow$ flat seam, so $(E_8)_1$ rationality $\Rightarrow f = 0$ (conditional on Route A); [O] Flat-Away carries <i>zero</i> new open content beyond Route A — the two SEAM.EQUIV.01 routes converge on one rationality fact.                               |
| v301_route_a_invertible.py       | SEAM.EQUIV.A.INV.01 — discharge Route A’s last open hypothesis (‘the raw quasi-free seam bulk is invertible/SRE’) via the free-fermion classification; since v300 collapsed Route B into Route A, this is the last unconditional gap of SEAM.EQUIV.01. [E] carrier = 16 Majoranas, $c = 8$ ( $g_{\text{car}} + N_{\text{fam}} = 5 + 3 = 8 = 16/2$ , v148); [E] $SO(16)_1 \supset (E_8)_1$ : $\dim \mathfrak{so}(16) = 120$ currents + 128 spinor = 248 = $\dim E_8$ (v154); [C] free-fermion invertibility (Kitaev): a gapped Gaussian/quasi-free 2+1D fermion phase (class D) is $\mathbb{Z}$ -classified by the chiral Majorana number and is <i>always</i> invertible (no intrinsic anyons; topological order needs interactions), so a gapped quasi-free bulk is invertible automatically; [E] the invariant $ \det K  = \#\text{anyons}$ is 1 for $E_8$ (invertible) vs 4 for the gauged $D_8=SO(16)$ (anyons), which free fermions cannot produce; [O] LIT-A’s ‘invertible bulk’ now follows from ‘gapped 16-Majorana quasi-free bulk’ (v148/v160+the gap), so the residual changes from a topological-order statement to the spectral input ‘is the quasi-free bulk gapped?’; [O] with v300 the whole open content of SEAM.EQUIV.01 reduces to the single spectral statement ‘the quasi-free seam bulk is gapped’. |

| v302_seam_gap.py           | <p>SEAM.EQUIV.GAP.01 — the last lever: after v300/v301 the whole open content of SEAM.EQUIV.01 was ‘the quasi-free seam bulk is gapped’; that gap is <i>not</i> a free input but the established Recovery gap of the seam transfer operator. [E] <math>\text{spec}(T) = \{1, (2/3)^6, (1/3)^6\}</math> (v160/v162), a simple leading Perron eigenvalue 1; [E] the gap is derived: <math>\Delta = -\ln((2/3)^6) = 6 \ln(3/2) = 2N_{\text{fam}} \ln(3/2) \approx 2.4328 &gt; 0</math> (multiplicative gap <math>1 - (2/3)^6 = 665/729</math>; <math>6 = 2N_{\text{fam}}</math>, <math>(2/3)^6</math> the <math>\mu_4</math>-deck transfer eigenvalue forced by the carrier); [E] the positivity margin <math>\Delta - 31/(4\pi^2) = 1.6476 &gt; 0</math> (the v76 decoupling margin); [C] by Osterwalder–Schrader / quasi-free clustering a transfer gap <math>\Delta &gt; 0</math> is a mass gap of the reconstructed Hamiltonian; [O] so the last TFPT-internal input is the derived Recovery gap <math>6 \ln(3/2) &gt; 0</math>, and SEAM.EQUIV.01’s residual is a composition of cited theorems (OS/clustering + Kitaev v301 + the v297 AQFT stack) over established TFPT facts — no undischarged TFPT-internal assumption remains, though it stays [O] (not machine-proved end-to-end).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| v303_ftransfer_dynamics.py | <p>FR.DYNAMICS.01 — the discrete→dynamic lens on F_transfer: the main-branch mechanism (a gapped, positivity-preserving relaxation to a <i>unique</i> attractor; the local-averaging update → the <math>E_8</math> marks, gap <math>6 \ln(3/2)</math>) is the shared <i>shape</i> of all four instances. [E] F_pole (Koide) <i>is</i> the seam dynamics — the source→pole/branch relaxation is the Möbius map with fixed-point multiplier <math>F' = (2/3)^6 = \lambda_2</math>, the seam-clock subleading eigenvalue (v82/v54); <math> F'  &lt; 1 \Rightarrow</math> a unique attractor at the seam rate; [C] F_Boltzmann (<math>\eta_B</math>) is a gapped positive contraction (washout <math>\kappa_f \in (0, 1)</math>, H-theorem; compiler fixes <math>A_\Lambda = 10</math>, rate thermal); [C] F_relic (axion) freezes at an adiabatic fixed point (seed <math>\theta_i = 3\pi/5</math>, rate cosmological); [E] F_QCD (<math>m_p/m_e</math>) is the 1-loop RG flow with the carrier <math>b_3 = -7</math> (asymptotic freedom <math>\Rightarrow</math> the Gaussian UV attractor, <math>\Lambda_{\text{QCD}}</math> generated). [O] Verdict: one shape underlies all four = the main-branch principle; F_pole has the seam rate exactly, the other three share only the shape (external rates), so F_transfer is the readout end of the one principle, not a bolt-on — simplicity is preserved by honest fencing (v187).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v304_idg_nonlocal_ghost.py | <p>QGAMB.IDG.01 — the KMS spectral-action cutoff suggests a <i>nonlocal</i> (infinite-derivative) graviton form factor; under entire analyticity the Stelle ghost is a <i>truncation artefact</i> — a [C] narrowing of the red-team rt_F perturbative-gravity attack, <i>not</i> a closure of QG.AMB.01 (no new parameter: the cutoff is the v259 seam KMS weight). [E] the local four-derivative propagator <math>1/(p^2(p^2 + M^2)) = (1/M^2)[1/p^2 - 1/(p^2 + M^2)]</math> has a healthy massless graviton (residue <math>+1/M^2</math> at <math>p^2=0</math>) and a massive spin-2 mode with <i>negative</i> residue <math>-1/M^2</math> at <math>p^2 = -M^2</math> (the Stelle ghost, reproducing v278); [E] for an IDG operator <math>p^2 a(p^2)</math> with <math>a(z) = e^{z/M^2}</math> entire and nowhere zero, the dressed propagator <math>1/(p^2 a)</math> keeps its <i>only</i> pole at <math>p^2=0</math> — no ghost (Tomboulis 1997; Biswas–Mazumdar–Siegel 2006); [E] negative control: a polynomial truncation <math>a(z) = 1 + z/M^2</math> (the <math>R+R^2</math> order) has a real zero at <math>z = -M^2</math> = the ghost pole, so ‘entire vs polynomial’ is the discriminator; [C] the cutoff is the <math>\beta=1</math> seam KMS weight <math>f(u) = e^{-u}</math> (v259), not a choice — truncating <math>\text{Tr} e^{-D^2/\Lambda^2}</math> at <math>a_4</math> is what makes the local <math>R+R^2</math> and the ghost; [C] <b>conditional narrowing</b>: <i>if</i> the resummed form factor is entire (Biswas–Mazumdar–Siegel class) <i>then</i> the perturbative graviton is ghost-free and rt_F’s attack is a truncation artefact; [O] <b>open</b>: (i) the trace regulator <math>f</math> is not the kinetic form factor <math>a(\square)</math> — entire analyticity of the resummation is unproven; (ii) a ghost-free <i>perturbative</i> graviton is not the nonperturbative ambient measure — QGAMB.IDG.01 stays [C]/[O], not a QG.AMB.01 closure.</p> |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v305_witness_independence.py  | Witness-independence / generator-economy audit (structural anti-numerology firewall, companion to v100): every headline integer is a documented image of the single anchor $a=(1,1,2)$ ( $e=(4,5,2)$ , $p_n=2+2^n$ ; v23/v228), $\pi$ the only transcendental primitive (ARCH.CORE.01) — 13 atoms / 2 free primitives = $6.5 \times$ compression made explicit (the recurring $2/3= \mathbb{Z}_2 /N_{\text{fam}}$ and $(2/3)^6$ are <i>one</i> ratio); $E_8/g_{\text{car}}$ /anchor are overdetermined ( $\geq 3$ structurally independent witnesses), the 5 pure-seed readouts single-witness (correlated, scored jointly by v100); $\alpha^{-1}$ 's '137' is foreign to the anchor family = an independent witness [E] |
| v306_seed_crossval.py         | Leave-one-out cross-validation of the shared seed $\varphi_0$ : back-solving $\varphi_0$ independently from the five seed-grammar observables ( $\sin^2 \theta_{12}$ , $\sin^2 \theta_{13}$ , $\beta$ , $\Omega_b$ , $\lambda_C$ ) and error-weighted-averaging reproduces the axiom seed $\varphi_0=1/(6\pi)+48c_3^4=0.0531720$ to 0.04% (one real seed, not a per-observable fit); leave-one-out predicts every held-out observable within $3\sigma$ out of sample (most-tensioned = $\sin^2 \theta_{13}$ , $\sim 2\sigma$ ); a data $\leftrightarrow$ formula shuffle explodes the $\chi^2$ by $> 100 \times$ [E]                                                                                                     |
| v307_data_watchdog.py         | Data watchdog: the operational decision pipeline over the frozen registry (v84). Classifies all 20 entries (16 predictions + 2 assigned textures + 2 bands) PASS/WATCH/TENSION/KILL by live $n_\sigma$ vs repo-documented current bests (CODATA 2022, NuFIT 6.0, ACT DR6, Planck 2018, PDG 2024, BK18); no decidable prediction in KILL (theory alive); watch items $\alpha^{-1}$ ( $1.9\sigma$ ), $s_{23}$ ( $1.8\sigma$ ) and the most-tensioned core $\sin^2 \theta_{13}$ ( $2.0\sigma$ ); the prediction-of-record $\sin^2 \theta_{12}=0.306747$ compatible (JUNO, the fastest falsifier); $r \in [0.0033, 0.0048]$ below the BK18 limit and the kill 0.01; $w=-1$ flagged the dark-energy watchdog (DESI) [E]       |
| v308_seam_equiv_chain.py      | TOE attack 1 — the SEAM.EQUIV.01 keystone as a composition certificate: the v297 stack as one well-typed chain $\text{gap}>0 \rightarrow \text{invertible} \rightarrow \text{holomorphic } c=8 \rightarrow (E_8)_1$ with exact discriminators $ \det \text{Cartan}(E_8) =1$ vs $ \det \text{Cartan}(D_8) =4$ , carrier tower $4 \cdot 4=16 \rightarrow 4 \rightarrow 1$ , $c=g_{\text{car}}+N_{\text{fam}}=8$ ; the input gap is the derived recovery gap $6 \ln(3/2)>0$ . The only undischarged premise is the cited OS step — an assembly/reduction certificate (Lean target), NOT a closure [E][O]                                                                                                                    |
| v309_modular_bedrock.py       | TOE attack 2 — the bedrock $\omega \circ \rho = \omega$ via an explicit modular Hamiltonian, non-circular: marks = 4 from Gauss–Bonnet (v216) + the order-4 clock from cross-ratio 2 (v214) $\Rightarrow \mu_4$ derived, not assumed; the quasi-free modular Hamiltonian $K = \log((1-C)/C)$ round-trips to the seam operator and $[\rho, K]=0 \Leftrightarrow \omega \circ \rho = \omega$ (a $\mathbb{Z}_2$ profile breaks it). Residual = Bisognano–Wichmann intrinsicality of the raw collar; NOT a closure of QGEO.SYM.01 [E][O]                                                                                                                                                                                     |
| v310_carrier_sm_anomaly.py    | TOE attack 3 — the carrier half-spinor is one anomaly-free SM generation with the SM RG: $16=\Lambda^{\text{even}}(\mathbb{C}^5)=1+10+5 \rightarrow SU(5) \subset SO(10)$ as $10+5+1 = \text{one generation}$ ; gauge-anomaly-free ( $\sum Y=0$ , $\sum Y^3=0$ , $[SU(2)]^2 U(1)=[SU(3)]^2 U(1)=0$ , exact) and reproduces $(b_1, b_2, b_3)=(\frac{41}{10}, -\frac{19}{6}, -7)$ ; a fourth family shifts $b_1$ , so $N_{\text{fam}}=3$ pins the RG. Closes the spectrum/anomaly/ $\beta$ sub-question; the full EG $S$ -matrix + Yukawa stay open [E][C]                                                                                                                                                                 |
| v311_gap_decoupled_measure.py | TOE attack 4 — the physical QG measure as a gap-decoupled, exponentially-clustering object: the transfer spectrum $\{1, (2/3)^6, (1/3)^6\}$ gives geometric clustering at rate $(2/3)^6$ , correlation length $1/(6 \ln(3/2))$ , finite susceptibility $729/665$ ; the v76 margin $6 \ln(3/2) - 31/(4\pi^2) \approx 1.648 > 0$ decouples the physical sector from the un-built ambient. Spectral-action $a_2=EH/a_4=R^2/72$ (v36) + KMS $\beta=1$ (v259); QG.AMB.01 stays [O] (gap-decoupled, inert) [E][O]                                                                                                                                                                                                              |

*continued on next page*

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v312_hypergraph_substrate.py  | TOE attack 5 — the hypergraph substrate sharpened: the affine- $E_8$ Kac marks are the Perron eigenvector ( $A m=2m$ ) and the subleading eigenvalue is exactly $2 \cos(\pi/5) =$ the golden ratio (the 5-fold/icosahedral signature), but the recovery rate $(2/3)^6$ is <i>not</i> any eigenvalue and $\varphi_0$ is not a rational edge fraction; so a full-structure rewrite must inject exactly two non-graph-spectral data — the cusp weight $2/3 =  \mathbb{Z}_2 /N_{\text{fam}}$ (gap $6 \ln(3/2)$ ) and the analytic seed $\varphi_0$ . The open question is precisely delimited, not closed [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| v313_golden_atoms_spectral.py | The golden ratio is the $g_{\text{car}}=5$ signature: the $(2, 3, 5)$ atoms <i>are</i> the affine- $E_8$ network spectral angles (v312 follow-up, exact). [E] the charpoly factors $x(x^2-4)(x^2-1)(x^2-x-1)(x^2+x-1)$ , the golden minimal polynomial $x^2-x-1$ divides it ( $\phi=2 \cos(\pi/5)$ an exact eigenvalue); the non-trivial eigenvalues are $2 \cos(\pi/k)$ for $k \in \{2, 3, 5\} = \{ \mathbb{Z}_2 , N_{\text{fam}}, g_{\text{car}}\}$ (giving $0, 1, \phi, 1/\phi$ ), so the golden ratio is the $g_{\text{car}}=5$ (5-fold) signature — a new spectral witness for $g_{\text{car}}$ (raises the v305 multiplicity). The $(2, 3, 5)$ spherical excess $1/2+1/3+1/5=31/30$ ties the v63/v76 margin numerator $31=2^{g_{\text{car}}}-1=248/8=1+h$ to the Coxeter 30 (a unification, not new evidence). [E] honest null: $\phi$ is structural, not a readout. [C] direction: $\phi$ is the $E_8$ -quasicrystal (Elser-Sloane) ratio, a candidate substrate [E][C]                                                                                                                                                                       |
| v314_rate_translation.py      | Do the discrete-kernel and dynamic rates translate? An exact number-field split. The affine- $E_8$ adjacency spectrum splits into the rational part $\{0, \pm 1, \pm 2\}$ in $\mathbb{Q}$ and the golden part $\{\pm \phi, \pm 1/\phi\}$ in $\mathbb{Q}(\sqrt{5})$ ; the dynamic transfer spectrum $\{1, (2/3)^6, (1/3)^6\}$ is entirely rational. [E] the family rates DO translate (the rational angles $2 \cos(\pi/2)=0= \mathbb{Z}_2 $ , $2 \cos(\pi/3)=1=N_{\text{fam}}$ build the recovery rate $(2/3)^6 = ( \mathbb{Z}_2 /N_{\text{fam}})^{2N_{\text{fam}}}$ in $\mathbb{Q}$ ), but the carrier 5-fold (golden, $\mathbb{Q}(\sqrt{5})$ ) has <i>no</i> rational dynamic image — a field obstruction, so it is static-only. The shared object is the order-30 Coxeter element ( $30=g_{\text{car}}(2N_{\text{fam}})=5 \cdot 6$ ); the $\phi$ quasicrystal carries the carrier, not the cusp-weight family dynamics [E][C]                                                                                                                                                                                                                      |
| v315_coxeter_coupling.py      | Couple or factorize? The order-30 Coxeter sectors couple as a cyclotomic field (v314 follow-up). [E] GROUP FACTORIZES: $\gcd(5, 6)=1 \Rightarrow \mathbb{Z}/30 = \mathbb{Z}/5 \times \mathbb{Z}/6$ (direct product, group-decoupled); [E] EXPONENTS FACTOR: $E_8$ exponents = totatives(30) = totatives(5) $\times$ totatives(6), $\phi(30)=4 \cdot 2=8 =$ rank $E_8$ ; [E] FIELD COUPLES: $[\mathbb{Q}(\zeta_{30}):\mathbb{Q}]=8 =$ rank $E_8$ , $\mathbb{Q}(\zeta_{30})$ is the compositum of the carrier $\mathbb{Q}(\zeta_5) (\ni \sqrt{5})$ and the family $\mathbb{Q}(\zeta_3)$ ; [E] GALOIS = $\mu_4 \times \mathbb{Z}_2$ : $(\mathbb{Z}/30)^\times = (\mathbb{Z}/5)^\times \times (\mathbb{Z}/3)^\times = \mathbb{Z}/4 \times \mathbb{Z}/2$ (order 8, max order 4), $\mu_4=(\mathbb{Z}/5)^\times$ the carrier Galois (the seam clock = the carrier golden-field Galois), $\mathbb{Z}_2=(\mathbb{Z}/3)^\times$ the family Galois; [E] $\sqrt{5}=\phi+1/\phi$ = the Gauss sum in $\mathbb{Q}(\zeta_5)$ . [C] $30=5 \cdot 6$ does not dynamically entangle — it couples as the cyclotomic compositum, the bridge is Galois not dynamical [E][C] |
| v316_galois_readout.py        | Does the Galois $\mu_4 \times \mathbb{Z}_2$ (v315) organize the physical readouts? Yes — the CP phases. [E] the hexagonal CP unit $\rho=\zeta_6=\zeta_{30}^5$ is the order-6= $2N_{\text{fam}}$ FAMILY factor $c^5$ (the carrier is $\zeta_5=\zeta_{30}^6$ ); [C] $\delta_{\text{CKM,lead}}=\pi/3=\arg \zeta_6$ , $\delta_{\text{PMNS}}=4\pi/3=\arg \zeta_6^4$ (power $4= \mu_4 $ ), $\zeta_6^4 = -\zeta_6$ the sheet flip ( $\mu_6=\mu_3 \times \mu_2$ ); [E] the Galois $\mathbb{Z}_2=\text{Gal}(\mathbb{Q}(\zeta_6)/\mathbb{Q})=\{\zeta_6 \mapsto \zeta_6^5=\bar{\zeta}_6\}$ IS CP conjugation ( $\delta \mapsto -\delta$ ); [E] the carrier factor $\zeta_5$ (golden $\sqrt{5}$ ) carries no phase (static); [E] the magnitudes ( $\sin^2 \theta_{12}=1/3-\varphi_0/2$ , transcendental $\varphi_0$ ) are not cyclotomic. So the Galois bridge reaches phenomenology through the family factor (phases); the carrier is static; the magnitudes are the analytic seed [E][C]                                                                                                                                                                      |

| Script                      | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v317_galois_family.py       | Are the 3 generations a $\mu_3$ /Galois orbit? Yes ( $\mu_3$ ), refined 1+2 by Galois (v316 follow-up). [E] the 3 cusp weights $\{0, 1/3, 2/3\}$ ( $\text{Spec}(Q_+) = \{1, 2, 3\} = A_3$ exponents) map under $w \mapsto e^{2\pi i w}$ to the cube roots $\{1, \zeta_3, \zeta_3^2\}$ ; the cyclic family symmetry $w \mapsto w+1/3$ is a transitive $\mu_3$ orbit (the family IS the cube-root orbit). [E] the transfer eigenvalues $(1-w)^6 = \{1, (2/3)^6, (1/3)^6\}$ attach to the weights (attractor = eigenvalue 1 at $w=0$ ). [E] the Galois $\mathbb{Z}_2$ ( $\zeta_3 \mapsto \zeta_3^2$ , = CP conjugation v316) fixes $w=0$ (rational) and swaps $w=1/3 \leftrightarrow 2/3 \Rightarrow$ orbit 1+2; so the Galois-FIXED generation is the recovery ATTRACTOR (the law), the Galois PAIR the decaying hierarchy. [C] the family structure is arithmetic; the mass magnitudes stay the analytic seed [E][C]                                                                                                                                                                                                                                                                                                                                                                                                   |
| v318_arithmetic_capstone.py | The capstone: the SM structural sector is $\mathbb{Q}(\zeta_{30}) + \text{Galois } \mu_4 \times \mathbb{Z}_2$ , and the complete input is $\{a, \pi, v_{\text{geo}}\}$ (synthesis of the v313–v317 arc). [E] the structural sector (3 generations, 2 CP phases, orbit/hierarchy) lives in $\mathbb{Q}(\zeta_{30})$ : $[\mathbb{Q}(\zeta_{30}):\mathbb{Q}] = \varphi(30) = 8 = \text{rank } E_8$ , $30 =  \mathbb{Z}_2  N_{\text{fam}} g_{\text{car}} = h(E_8)$ , Galois $(\mathbb{Z}/30)^\times = \mu_4 \times \mathbb{Z}_2$ ; [E] rigidity: forced by the anchor atoms $\{2, 3, 5\} = e(a)$ ; [E] magnitude reduction: $\varphi_0 = (4/3)c_3 + 48c_3^4$ is a pure function of $\pi$ (no free parameters), so the magnitudes are $\{a, \pi\}$ -determined, not free; [E] free inventory: 0 dimensionless free parameters, $\pi$ the unique transcendental, $v_{\text{geo}}$ the one dimensional unit. [O] residual: the raw-seam realisation stays open (QGEO.SYM.01/SEAM.EQUIV.01) [E][O]                                                                                                                                                                                                                                                                                                                            |
| v319_translation_clock.py   | The translation clock: the discrete $\leftrightarrow$ dynamic bridge is the order-30 Coxeter element, a clock with two coprime hands $5 \times 6$ , read law-inclusive (0..5) or live-only (1..5). [E] the only object holding both the static carrier ( $\mathbb{Q}(\sqrt{5})$ ) and the dynamic family (rational) data is the order-30 Coxeter element (v314); $30 = h(E_8) = g_{\text{car}}(2N_{\text{fam}}) = 5 \cdot 6$ , $\text{gcd}(5, 6) = 1 \Rightarrow \mathbb{Z}/30 = \mathbb{Z}/5 \times \mathbb{Z}/6$ (v315). [E] DYNAMIC HAND ( $\mathbb{Z}/6 = 2N_{\text{fam}}$ , ticks 0..5): recovery exponent exactly $6 = 2N_{\text{fam}}$ , rate $(2/3)^6$ ; order-6 generator $c^5$ ( $\zeta_6 = \zeta_{30}^5$ ). [E] LAW VS LIVE: the resummed clock rate( $n$ ) = $-p_2 \ln(1 - n/N_{\text{fam}})$ (v124) has rate(0) = 0 (the attractor/law) and live modes from $n=1$ ; the $E_8$ live phases (totatives of 30) start at 1, so 0, 1, 2, 3, 4, 5 is law-inclusive, 1, 2, 3, 4, 5 live-only. [E] STATIC HAND ( $\mathbb{Z}/5 = g_{\text{car}}$ , ticks 1..5): golden $\mathbb{Q}(\sqrt{5})$ , field-obstructed (no rational dynamic image) — static-only. [E] one full turn = $\text{lcm}(5, 6) = 30 = h(E_8)$ (rank $E_8 = 8 = \varphi(30)$ , $ \mu_4 =4$ planes, v55); the “it is one clock” reading is [C]. |
| v320_galois_cp_relation.py  | A NEW falsifiable prediction from the Galois structure: the two CP phases are locked, $\delta_{\text{PMNS}} = \delta_{\text{CKM}}^{\text{lead}} + \pi$ . [E] both phases are powers of one hexagonal unit $\rho = \zeta_6$ (v316): $\delta_{\text{CKM}}^{\text{lead}} = \arg \rho = \pi/3$ ( $60^\circ$ ), $\delta_{\text{PMNS}} = \arg \rho^4 = 4\pi/3$ ( $240^\circ$ ), $\rho^4 = -\rho$ , so $\delta_{\text{PMNS}} - \delta_{\text{CKM}}^{\text{lead}} = \pi$ exactly (the $\mathbb{Z}_2$ sheet flip) — the quark and lepton leading CP phases are NOT independent. [C] prediction of record $\delta_{\text{PMNS}}^{\text{lead}} = 240^\circ$ (upgrades the assigned texture to a Galois-forced relation to the measured quark phase); [C] currently within the broad NuFIT 6.0 range; [X] kill test: $\delta_{\text{PMNS}}$ robustly away from $240^\circ$ ( $> 3\sigma$ ; DUNE/Hyper-K/JUNO) falsifies the Galois-CP organization [E][C][X]                                                                                                                                                                                                                                                                                                                                                                      |
| v321_killtest_board.py      | The forward kill-test board: the decisive upcoming measurements, ranked (forward companion to v307). [E] each entry is locked to a freeze_file.csv kill row: #1 JUNO $\sin^2 \theta_{12} = 0.306747$ (fastest), #2 CMB-S4/LiteBIRD $r$ (kill $r > 0.01$ ), #3 DESI/Euclid $w = -1$ , #4 DUNE/Hyper-K $\delta_{\text{PMNS}} = 240^\circ$ (the new v320 Galois-CP relation), #5 DUNE/LEGEND/nEXO ordering + $m_{\beta\beta}$ , #6 PSI n2EDM, #7 JUNO $\sin^2 \theta_{13}$ ( $\sim 2\sigma$ now), #8 LiteBIRD $\beta$ . A forward decision ledger complementing v307; no new physics [E]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

*continued on next page*

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v322_cp_lock_sharpened.py    | The v320 CP-lock prediction sharpened into a quantitative kill test. [E] the leading CP phase sits on the six hexagonal nodes $\arg \rho^k = k \cdot 60^\circ$ ; $\delta_{\text{CKM}}^{\text{lead}} = 60^\circ$ (node 1), $\delta_{\text{PMNS}}^{\text{lead}} = 240^\circ$ (node 4). [E] the node selector is the deck order: $\delta_{\text{PMNS}}^{\text{lead}} =  \mu_4  \delta_{\text{CKM}}^{\text{lead}} = 4(\pi/3) = 4\pi/3 = \delta_{\text{CKM}}^{\text{lead}} + \pi$ ( $\rho^4 = -\rho$ ). [C] sub-leading budget: $\delta_{\text{CKM}}^{\text{full}} = \pi/3 + 3\lambda^2$ ( $\sim 68.7^\circ$ ); the lepton sub-leading is a separate open holonomy term bounded by $\sim 3\lambda^2 \approx 8.7^\circ \Rightarrow$ band $240 \pm \sim 9^\circ$ . [C] current tension: vs NuFIT 6.0 NO ( $\delta_{CP} = 212_{-41}^{+26^\circ}$ ) the leading $240^\circ$ sits at $+1.08\sigma$ , band edge $\sim 231^\circ$ at $+0.74\sigma$ . [X] kill: the nearest wrong node is $60^\circ$ away $\gg$ budget; DUNE/Hyper-K ( $\sim 5\text{--}15^\circ$ ) discriminate, $> 3\sigma$ outside kills the lock. [E] an anarchic $\delta_{CP}$ hits the band with $p \sim 5\%$ and node 4 1-in-6 [E][C][X]                                                                                                                         |
| v323_bw_geometric_modular.py | The keystone pushed one step: Bisognano–Wichmann makes the seam modular flow <i>geometric</i> , so the $\mu_4$ deck invariance is not an independent axiom. [E] the clock $\rho = \text{diag}(i^n) = \exp(i(\pi/2)L)$ is a geometric rotation ( $L = \text{diag}(n)$ , $\rho^4 = I$ , $\mu_4 \subset U(1)_{\text{rot}}$ ). [E] for a rotation-covariant $C = f(L)$ the modular Hamiltonian $K = \log((1 - C)/C) = g(L)$ , so $[K, L] = 0$ (the modular flow commutes with all rotations) and $[\rho, K] = [\rho, C] = 0$ — the clock is a modular symmetry for free. [E] discriminator vs v309: a period-4 curvature preserves the clock but its modular flow is <i>not</i> geometric ( $[K, L] \neq 0$ ); BW is strictly stronger. [C] linked bedrock: given the seam is the $(E_8)_1$ chiral net (v308), BW/Hislop–Longo make the vacuum modular flow geometric $\Rightarrow$ QGEO.SYM.01 ( $\omega \circ \rho = \omega$ ) is downstream of SEAM.EQUIV.01 + a rotation-invariant vacuum. [O] residual: the raw collar vacuum is rotation-invariant (cleaner than v309, shared with v308) [E][C][O]                                                                                                                                                                                                                      |
| v324_hypergraph_fiber.py     | The minimal hypergraph substrate that works: a $(2, 3, 5)$ -network <i>fibered</i> by a 3-fold cusp channel reproduces both the $E_8$ skeleton and the recovery gap (the constructive v312 follow-up). [E] network factor: $T_{\text{net}} = (A + 2I)/4$ fixes the Kac marks (eigenvalue $1 = E_8$ skeleton), subleading $(\varphi + 2)/4$ (golden); $(2/3)^6$ is <i>not</i> in its spectrum (the v312 negative). [E] cusp fiber: $T_{\text{cusp}} = \text{diag}((1 - w)^{2N_{\text{fam}}})$ , $w \in \{0, 1/3, 2/3\}$ ( $N_{\text{fam}} = 3$ , v317), spectrum $\{1, (2/3)^6, (1/3)^6\}$ . [E] the fibered substrate $T = T_{\text{net}} \otimes T_{\text{cusp}}$ has top eigenvalue 1 (eigenvector marks $\otimes$ ( $w = 0$ ), skeleton $\times$ democratic cusp) <i>and</i> $(2/3)^6$ as a genuine eigenvalue (network attractor $\times$ cusp subleading). [E] honest injection: without the fiber ( $T_{\text{net}} \otimes I_3$ ) there is no $(2/3)^6$ — the cusp datum is injected, not graph-spectral; substrate = network $\times$ cusp = the v315 split $30 = g_{\text{car}}(2N_{\text{fam}}) = 5 \cdot 6$ . [E] minimality: the smallest fiber is the 3-node cusp ( $= N_{\text{fam}}$ ) = order-30 (v319 clock). [C] a consistent fibered realization, not a derivation of $2/3$ from a pure rewrite [E][C] |
| v325_pillowcase_keystone.py  | The seam keystone as ONE citable theorem: the raw seam state <i>is</i> the flat $\tau = i$ pillowcase state, with <b>exactly one</b> open lemma. IF (raw RP-collar seam state = flat $\tau = i$ pillowcase / rotation-invariant state) THEN 4 square marks + $\mu_4$ deck + $\omega \circ \rho = \omega$ + holomorphic $c = 8 \Rightarrow (E_8)_1$ , with the carrier recovery gap as input. [E] pieces all exact: $n = 2\chi(S^2) = 4$ (v216); cross-ratio $2 \Rightarrow j = 1728$ (v214/v267); flat orbifold $S^2(2, 2, 2, 2)$ , $\chi_{\text{orb}} = 0$ (Trojanov); DtN sub-principal at $m \equiv 0 \pmod 4$ (v201/v280); $\det \text{Cartan}(E_8) = 1$ vs $D_8 = 4$ (v83/v143/v308); gap $6 \ln \frac{3}{2} > 0$ (v76/v302). [O] the one open lemma — the raw collar state IS the flat $\tau = i$ pillowcase / rotation-invariant state — is SHARED by both bedrock IDs (QGEO.SYM.01, SEAM.EQUIV.01; v323), machine-pinned in Lean (FORM.SEAMEQUIV.01 + FORM.QGEO.BW.01); an assembly/reduction certificate (like v176/v261), not a closure [E][O]                                                                                                                                                                                                                                                                  |

*continued on next page*

| Script                     | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v326_ftransfer_suite.py    | The $F_{\text{transfer}}$ solver suite: the four transfer readouts as ONE runnable harness, each a gapped relaxation to a unique attractor (productises v303). [E] $F_{\text{pole}}$ (Koide): Moebius contraction to $Q^*=2/3$ with multiplier $(2/3)^6$ = the seam-clock subleading eigenvalue, unique attractor at the SEAM rate. [C] $F_{\text{Boltzmann}}(\eta_B)$ : washout contraction to the balance $6.1 \times 10^{-11}$ , monotone (H-theorem), external thermal rate. [C] $F_{\text{relic}}$ (axion): the comoving number $N=E/\omega$ is the adiabatic invariant, the relic freezes (seed $\theta_i=3\pi/5$ ), cosmological rate. [E] $F_{\text{QCD}}(m_p/m_e)$ : 1-loop RG with carrier $b_0=7$ flows to the Gaussian UV fixed point, $\Lambda_{\text{QCD}}$ generated. [C] $F_{\text{RareKaon}}$ : $\text{BR}(K^+)=9.45 \times 10^{-11}$ on NA62 2016-2024 (v202). [O] only $F_{\text{pole}}$ has the seam rate $(2/3)^6$ ; the other four share the SHAPE with external rates honestly fenced (v187/v303) — the frontier is measurable without claiming the external rates [E][C][O] |
| v327_hypergraph_rewrite.py | Deriving the cusp weight $2/3$ from a minimal rewrite (sharpening v324/v312). A minimal local rule — a family channel with $N_{\text{fam}}=3$ slots, one absorbing attractor ( $w=0$ ) and $ \mathbb{Z}_2 =2$ surviving — supplies the cusp fiber. [E] $M$ has spectrum $\{1, 2/3, 0\}$ ; $2/3=(N_{\text{fam}}-1)/N_{\text{fam}}= \mathbb{Z}_2 /N_{\text{fam}}$ EMERGES from the rule arity, not injected. [E] over the order-6= $2N_{\text{fam}}$ hand the rate is $(2/3)^6=64/729$ = the recovery gap (v76/v324), derived. [E] NON-GRAPH-SPECTRAL (proof, sharpening v312): $2/3$ is NOT a root of the affine- $E_8$ charpoly ( $p(2/3)=-3520/19683 \neq 0$ ), so the recovery rate cannot be an adjacency eigenvalue. [E] the absorbing state (eigenvalue 1) is the democratic $w=0$ law (v317). [O] honest residual: the arity $\{2, 3\}$ (the anchor atoms) is still the input (P2) — v324's injected datum reduced to the anchor arity [E][O]                                                                                                                                                 |
| v328_theta13_pressure.py   | The $\theta_{13}$ pressure point: the honest weak spot, quantified and pre-registered. [C] $\sin^2 \theta_{13}=\varphi_0^{\text{ret}}e^{-5/6}=0.023108$ vs NuFIT 6.0 NO ( $0.02195 \pm 0.00058$ ) is $+2.0\sigma$ — the most-tensioned CORE prediction (v62/v307). [E] $\theta_{13}$ is the carrier hypercharge trace (exponent $\gamma=\text{tr}_E Y^2=5/6$ EXACT, v268), NOT the seesaw $\mu\tau$ breaking that sets $\theta_{12}$ — distinct channels. [C] no cheap relief: the back-solved seed $\varphi_0^{\text{ret}}(\theta_{13})=0.0505$ is $\sim 5\%$ below the axiom, PMNS $\theta_{13}$ RG running is $< 1\%$ (NO), and $5/6$ is exact — the prediction stays frozen (REG.FREEZE.01). [X] pre-registered kill: a stable $\sin^2 \theta_{13}$ away from 0.023108 at $> 3\sigma$ (JUNO/global) flags the carrier-trace/seed-grammar reading; exactly the v306 seed-hyperplane outlier — one honest pressure point [C][E][X]                                                                                                                                                                |
| v329_os_gap_reduction.py   | Closing the OS step: the bulk gap <i>is</i> the transfer gap (second quantization), and assembling the single sufficient premise of the whole bedrock. [E] OS GAP = TRANSFER GAP: the many-body OS Hamiltonian $d\Gamma(-\log T)$ has spectrum = sums of single-mode energies, so the bulk gap = the smallest positive single-mode energy = $6 \ln \frac{3}{2}$ , independent of system size — exactly “OS bulk gap = transfer gap” (the v308 open input), discharged at the many-body level. [E] $H \Rightarrow \omega \circ \rho = \omega$ : under $H$ the covariance is rotation-covariant $C=f(L)$ , $K=g(L)$ commutes with $\rho=\exp(i(\pi/2)L)$ (v201/v309/v323). [E] $H \Rightarrow \text{SRE} \Rightarrow (E_8)_1$ : $\det \text{Cartan}(E_8)=1$ vs $D_8=4$ (v237/v308). [E] both bedrock IDs follow from the ONE premise $H$ (Lean-pinned FORM.SEAMEQUIV.01 + FORM.QGEO.BW.01). [O] residual: the necessity of $H$ on the raw collar; sharpens v240/v308/v323/v325, does NOT close the bedrock [E][O]                                                                                     |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v330_qgamb_admissible_measure.py | Constructing the ambient measure on the gap-decoupled admissible sector as a bona fide Osterwalder–Schrader object (with the honest fence). [E] reflection positivity: the seam transfer $T$ (v221/v311; spectrum $\{1, (2/3)^6, (1/3)^6\}$ ) is symmetric PSD, so the finite-volume measures are RP. [E] exponential clustering: $C(n)/C(n-1) \rightarrow \lambda_2 = (2/3)^6$ ( $\xi=1/\Delta$ , $\Delta=6 \ln \frac{3}{2}$ ). [E] tightness $\Rightarrow$ projective limit: $\chi = \sum_n C(n) = 729/665$ finite, so $\text{Var}(S_\Lambda)/\Lambda \rightarrow \chi \Rightarrow$ uniform tightness (Prokhorov) $\Rightarrow$ the projective limit $\mu = \lim \mu_\Lambda$ EXISTS on the admissible sector. [E] OS reconstruction: $H_{\text{OS}} = -\log T \geq 0$ , unique vacuum, gap $6 \ln \frac{3}{2}$ (v240). [E] NEG: an ungapped transfer sends $\chi \rightarrow \infty$ , tightness fails. [O] the full ambient measure: the non-admissible (metric) sector is NOT built; by the gap margin $\Delta - 31/(4\pi^2) \approx 1.648 > 0$ (v76/v275) the physical readouts do not need it, but QG.AMB.01 stays open. A genuine PARTIAL construction, NOT a closure [E][O]                                                                                   |
| v331_necessity_of_H.py           | The <i>necessity</i> of $H$ reduced: rotation-invariance of the seam DtN is EQUIVALENT to the four marks at the square ( $\tau=i$ ), so the one open lemma is exactly the order-4 CM selection (the necessity companion to v329’s sufficiency). [E] square $\Rightarrow [\rho, \Lambda]=0$ : marks at $\{0, \pi/2, \pi, 3\pi/2\}$ make the curvature $\mathbb{Z}_4$ -symmetric (Fourier support $0 \bmod 4$ ), $M_f$ couples only modes differing by $4\mathbb{Z}$ (the v201/v210 sufficiency as a DtN $ k +M_f$ operator). [E] necessity: a mark off the square breaks $\mathbb{Z}_4$ and gives $[\rho, \Lambda] \neq 0$ — equivalence, not just implication. [E] order-4 CM: cross-ratio( $1, i, -1, -i$ ) $=2 \Rightarrow j=1728$ , the unique 4-config with an order-4 automorphism (v214/v267); $H \Leftrightarrow$ square $\Leftrightarrow \mu_4$ . [E] NEG: a $\mathbb{Z}_2$ mark set commutes with $\rho^2$ but not $\rho$ . [O] residual: the dynamical <i>selection</i> of the square (the 4 marks forced by v216) is the irreducible postulate; does NOT close the bedrock [E][O]                                                                                                                                                                           |
| v332_qgamb_metric_sector.py      | The metric sector of QG.AMB.01 characterized: the obstruction is exactly the conformal-mode (Gibbons–Hawking–Perry) problem, the physical sector is gap-insulated, and the only route is the conditional IDG taming (makes v330’s metric-sector fence precise). [E] conformal-mode wrong sign: $c_{\text{conf}}(D) = -(D-1)(D-2)/4$ is negative for $D \geq 3$ ( $c_{\text{conf}}(4) = -3/2$ ), TT positive — the conformal-factor problem. [E] measure obstruction: the kinetic form is indefinite (one negative eigenvalue), so $e^{-S}$ diverges over the conformal mode; the bare metric-sector measure is not directly definable. [E] physical sector insulated: the obstruction is in the conformal/gauge direction, not the admissible sector (positive+gapped, v330), margin $\Delta - 31/(4\pi^2) \approx 1.648 > 0$ (v76). [C] IDG conditional route: the entire form factor $e^{z/M^2}$ (v259/v304) dresses the conformal propagator with no extra pole. [E] NEG: a polynomial $(R+R^2)$ truncation crosses zero (the Stelle ghost, v304/v278). [O] metric sector open: the full QG.AMB.01 needs the conformal mode resolved nonperturbatively (GHP rotation / IDG), gap-decoupled but NOT constructed. A precise characterization, NOT a closure [E][C][O] |
| v333_cm_selection.py             | The CM-selection mechanism: $\tau=i$ (the square) is the UNIQUE order-4 modulus and the attractor of mark-equilibration, so the last keystone residual is “the deck acts geometrically”, not “why the square” (the v331 follow-up). [E] order-4 modular element: $S = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$ in $\text{SL}(2, \mathbb{Z})$ has $S^2 = -I$ , $S^4 = I$ and fixes $\tau=i$ — the unique order-4 elliptic point of $\text{PSL}(2, \mathbb{Z})$ (the other, $\rho$ , is order 3). [E] deck order $\rightarrow$ CM point: order-4 $\rightarrow$ cross-ratio 2 $\rightarrow j=1728 \rightarrow \tau=i$ (square); order-3 $\rightarrow j=0 \rightarrow \tau=\rho$ (hexagon); $ \mu_4 =4$ selects $\tau=i$ . [E] mark-equilibration attractor: 4 points minimizing the log-energy (Fekete) converge to equal spacing (gaps $\pi/2 =$ the square), and beat random perturbations — the unique (mod rotation) attractor. [E] NEG: an order-3 deck selects $\rho$ , not the square. [O] residual: only “the deck acts <i>geometrically</i> (= QGEO.SYM.01) vs an abstract $\mathbb{Z}_4$ on labels” stays open — sharpened from “why the square” to “the deck acts geometrically”, NOT a closure [E][O]                                                   |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v334_conformal_resolution.py | The conformal-mode resolution: the Gibbons–Hawking–Perry contour rotation (IR sign) + the infinite-derivative (IDG) dressing (UV pole) give a <b>CONDITIONALLY</b> convergent metric-sector measure; the residual is the nonperturbative validity of the contour (the v332 follow-up). <b>[E]</b> the obstruction: $c_{\text{conf}}(4) = -3/2 < 0$ , the unrotated conformal Gaussian diverges. <b>[E]</b> GHP rotation: $\phi \rightarrow i\phi$ flips the sign, $\int e^{- c \phi^2} = \sqrt{\pi/ c }$ <b>FINITE</b> (GHP 1978). <b>[E]</b> IDG dressing: the entire form factor $e^{p^2/M^2} > 0$ (no ghost pole, v304), the dressed per-mode action positive post-GHP and UV-suppressed. <b>[E]</b> NEG: a polynomial truncation crosses zero (the Stelle ghost, v304/v278). <b>[C]</b> conditional construction: GHP+IDG give a convergent metric-sector Gaussian mode-by-mode (conditional on the contour + entire analyticity). <b>[O]</b> residual: whether the GHP-rotated IDG-dressed measure is the <b>CORRECT</b> nonperturbative <b>QG.AMB</b> measure (the contour’s nonperturbative validity); gap-decoupled (v76), blocks no test, <b>NOT</b> a closure <b>[E][C][O]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v335_seam_equiv_unify.py     | The keystone unification: there is <b>ONE</b> open theorem ( <b>SEAM.EQUIV.01</b> ), <b>QGE0.SYM.01</b> is its <b>COROLLARY</b> (a conformal-net axiom), and <b>QG.AMB.01</b> is a decoupled general QG problem, <b>NOT</b> a TFPT gate. <b>[E]</b> <b>QGE0.SYM.01</b> = corollary: a chiral conformal net has a Moebius-covariant vacuum (the unique invariant positive-energy vector, a <b>NET AXIOM</b> ); rotations $U(1) < \text{Moebius} \Rightarrow$ rotation-invariant vacuum; the $\mu_4$ clock = rotation by $\pi/2$ fixes it $\Rightarrow \omega \circ \rho = \omega$ . So <b>SEAM.EQUIV.01</b> $\Rightarrow$ <b>QGE0.SYM.01</b> with <b>NO</b> extra premise (the v323 “rotation-invariant vacuum” is a net axiom); the two bedrock items collapse to <b>ONE</b> . <b>[E]</b> the one keystone theorem: <b>SEAM.EQUIV.01</b> = a construction theorem ( $c=8$ , $\det \text{Cartan}(E_8)=1$ , gap $6 \ln \frac{3}{2} > 0$ derived) with <b>EXACTLY</b> one open continuum lemma. <b>[E]</b> <b>QG.AMB.01</b> decoupled: margin $\Delta - 31/(4\pi^2) \approx 1.648 > 0 \Rightarrow$ no TFPT prediction depends on it; the general Euclidean-QG conformal-factor problem (GHP 1978), inherited not TFPT-specific. <b>[E]</b> collapsed status: structural items $2 \rightarrow 1$ ; live residual $= v_{\text{geo}} + G_{\text{net}} (= \text{SEAM.EQUIV.01}) + F_{\text{transfer}}$ . <b>[O]</b> the one residual = <b>SEAM.EQUIV.01</b> ’s continuum OS reconstruction (Lean-pinned). A synthesis/inventory; does <b>NOT</b> close <b>SEAM.EQUIV.01</b> <b>[E][O]</b>                                                                                                                                                                                                                                 |
| v336_continuum_limit.py      | The <b>ONE</b> open lemma of <b>SEAM.EQUIV.01</b> , stated precisely and mapped to the recent rigorous literature – the continuum-limit and OS-reconstruction legs are now <b>CITABLE</b> . <b>[C]</b> continuum leg: Osborne–Stottmeister ( <i>CFT from Lattice Fermions</i> , CMP <b>398</b> (2023) 219, doi:10.1007/s00220-022-04521-8; legacy internal token MMST, on the MMST/Morinelli–Morsella–Stottmeister–Tanimoto OAR framework, arXiv:2010.11121) give the chiral-CFT scaling limit of free lattice fermions (Koo–Saleur $\rightarrow$ Virasoro, correct $c$ ); WZW range rank $\leq c \leq D$ . $(E_8)_1$ : $c=8$ , rank 8, $D=16$ Majoranas $(SO(16)_1 \rightarrow (E_8)_1)$ , $8 \leq c \leq 16$ in range; the collar is a gapped quasi-free (CAR) state. <b>[C]</b> OS leg: Adamo–Moriwaki–Tanimoto (arXiv:2407.18222, 2024) prove the conformal OS axioms (linear growth) for unitary VOAs incl. lattice VOAs; $(E_8)_1$ is the even self-dual rank-8 lattice VOA. <b>[C]</b> construction + covariance (Adamo–Giorgetti–Tanimoto): arXiv:2506.01008 builds the 2d conformal net of an even lattice and classifies the 2d Heisenberg-net extensions as lattice nets, and arXiv:2508.07109 shows every DHR rep of such a net is automatically positive-energy + diffeomorphism-covariant (covariance a consequence, not an input). <b>[E]</b> target pinned: $c=g_{\text{car}}+N_{\text{fam}}=8$ , $\det \text{Cartan}(E_8)=1$ , the $D=16$ Majorana $SO(16)_1$ IS the carrier-16 and the $\mu_4$ extension IS the seam glue. <b>[O]</b> open residual: $c=8$ alone does <b>NOT</b> pin the net ( $SO(16)_1$ also $c=8$ , $\det 4$ ), so the one open lemma = the holomorphy discriminator $\det K=1$ . A literature-mapping/reduction; does <b>NOT</b> close <b>SEAM.EQUIV.01</b> <b>[C][E][O]</b> |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v337_decoupling_theorem.py       | <p>THE DECOUPLING THEOREM (consolidated, citable): every TFPT dimensionless readout factors through the gapped admissible sector and is INDEPENDENT of the ambient QG measure – the theorem that makes the QG.AMB.01 reclassification (v335) honest. [E] gap margin: <math>\Delta - 2 \dim(E_8) c_3^2 = 6 \ln \frac{3}{2} - 31/(4\pi^2) \approx 1.648 &gt; 0</math>. [E] factorization: every readout (mass ratios, mixings, <math>\alpha^{-1}</math>, <math>R+R^2</math>) is a function of the admissible gapped transfer spectrum <math>\{1, (2/3)^6, (1/3)^6\}</math> + the discrete kernel alone. [E] the theorem: margin <math>&gt; 0 \Rightarrow</math> exponential clustering (<math>\lambda_2=(2/3)^6</math>), finite susceptibility <math>\chi=729/665</math>, so the ambient contribution is gap-suppressed <math>\Rightarrow</math> no readout depends on the ambient measure <math>\Rightarrow</math> QG.AMB.01 decoupled. [E] neg control: gap closed <math>\Rightarrow \chi</math> diverges <math>\Rightarrow</math> fails (non-vacuous). [E] corollary: zero frozen kill tests depend on the ambient measure. Consolidates v76/v311/v330/v332; does NOT construct the ambient measure [E]</p>                                                                                                                                          |
| v338_theta13_budget.py           | <p>THETA13.BUDGET.01: the <math>\theta_{13}</math> sub-leading budget vs the current global fit – the <math>+2\sigma</math> pressure point (v328) quantified against BOTH NuFIT 6.0 NO variants and JUNO; neither defuses nor excludes, fences correctly. [C] SK-dependent tension: <math>\sin^2 \theta_{13} = (\varphi_0^{\text{ret}}) e^{-5/6} = 0.023108</math> is <math>+2.0\sigma</math> vs the no-SK central (0.02195) and <math>+1.7\sigma</math> vs the with-SK NO best fit (0.02215) – not a clean <math>2\sigma</math>. [E] within <math>3\sigma</math>: <math>0.023108 &lt;</math> the with-SK <math>3\sigma</math> upper 0.02388 (not falsified). [C] budget: moving to the central needs <math>-4.1\%</math>; RG <math>&lt; 1\%</math> and the exponent <math>5/6</math> is exact <math>\Rightarrow</math> no freeze-respecting relief (v328). [X] JUNO decides: sub-1% precision turns <math>1.7\text{--}2.0\sigma</math> into <math>\sim 6\sigma</math> – a near-term pre-registered kill/confirm. One honest pressure point (v306/v328), fenced [C][E][X]</p>                                                                                                                                                                                                                                                                         |
| v339_firstprinciples_boundary.py | <p>The honest first-principles boundary, mapped precisely – answers (a) can <math>M_{\text{Planck}}/v_{\text{geo}}</math> be computed? and (b) can <math>F_{\text{transfer}}</math> be made first-principles? Both NO, with the exact reason per residual. [E] <math>v_{\text{geo}}/M_{\text{Planck}}</math> FORBIDDEN BY THEOREM (No-Unit, v153): a mass is dimension 1 while every TFPT datum is dimension 0, so no dimensionless map outputs a scale; over-determined (gravity = dark energy to 0.11%, v274); every dimensionless RATIO is derived, only the unit is not. [E] <math>m_p/m_e</math> structure in place (v262): the carrier <math>b_3=-7</math> drives the QCD run + the closed electron source; two inputs stay external: <math>\alpha_s(M_Z)</math> and the lattice <math>C_p=m_p/\Lambda^{(3)} \sim 2.83</math>. [X] <math>\alpha_s(M_Z)</math> external BECAUSE OF A TENSION: SM content does NOT unify (1-loop spread <math>\sim 8.8</math> at <math>2 \times 10^{16}</math> GeV, v246). [C] <math>C_p</math> parameter-free but lattice-only (v35). [C] <math>\eta_B/\text{axion}</math> = cosmological initial conditions; Koide <math>Q=2/3</math> structural [E]. [E] FOUR honest kinds: forbidden-by-theorem / external-parameter-free / external-tensioned / cosmological. A boundary audit, NOT a solution [E][C][X]</p> |
| v340_As_reconcile.py             | <p><math>A_s</math> is predicted (not missing), is DIMENSIONLESS (so it does NOT define an absolute mass), and the apparent <math>-11\sigma</math> tension is a reheating-channel question – reconciled with the archived old derivation (TFPT v4.5/v4.6). [E] <math>A_s = N_\star^2 (M_{\text{scal}}/\bar{M}_{\text{Pl}})^2 / (24\pi^2) = N_\star^2 c_3^7 / (24\pi^2)</math> (v86); <math>M_{\text{scal}}/\bar{M}_{\text{Pl}} = c_3^{7/2} = 1.2565 \times 10^{-5}</math> is a PURE RATIO, so <math>A_s</math> carries NO absolute scale – it pins <math>N_\star</math>, NOT <math>\bar{M}_{\text{Pl}} \Rightarrow A_s</math> does NOT define mass (No-Unit v153 stands). [C] the <math>-11\sigma</math> is the slow-vs-fast reheating dichotomy (<math>N_\star=51.44 \rightarrow A_s=1.764 \times 10^{-9}</math>; <math>A_s</math>-preferred <math>N_\star=56.2</math>). [C] ARCHIVE: old v4.5/v4.6 used the algebraic <math>N_\star=3/\varphi_0^{\text{ret}} - 1=55.42</math> and reported <math>A_s=2.124 \times 10^{-9}</math>; at that <math>N_\star</math> the current normalisation gives <math>2.047 \times 10^{-9}</math> (<math>-1.9\sigma</math>). [E] nothing lost: the current theory DERIVES <math>N_\star</math> (record band [50, 60], v84). [X] decisive test: fast preheating or slow reheating confirmed [E][C][X]</p>             |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v341_alpha_quillen.py        | <p>The <math>\alpha</math> fixed point reformulated as the STATIONARITY of a <math>U(1)</math> determinant line, every ingredient identified as an index / heat-kernel coefficient / discriminant form – NOT a free knob (the “derive the FORM” step).</p> <p><math>F_{U(1)} = \alpha^3 - 2c_3^3\alpha^2 - \frac{4}{5}c_3^6M \ln(1/\varphi_{\text{seam}}) = 0</math> in Quillen form: <math>[\alpha^3 - 2c_3^3\alpha^2]</math> (det-line variation) = <math>[8b_1c_3^6]</math> (anomaly counterterm) <math>\times [\ln(1/\varphi_{\text{seam}})]</math> (seam response). [E] <math>M=41</math> a <math>U(1)</math> INDEX (EM Ward, v48): <math>\frac{4}{5}M = 8b_1</math>, <math>b_1=41/10</math> the SM 1-loop <math>U(1)_Y</math> beta (v159/v246). [E] <math>c_3=1/(8\pi)</math> the GAUSS–BONNET boundary coefficient (<math>8=\text{rank } E_8</math>, v216); <math>c_3^{3,6}</math> heat-kernel powers. [E] <math>-5/4 = -q(D_5)</math> a DISCRIMINANT form (<math>q(D_5)+q(A_3)=2</math>, v1/v154); <math>\varphi_{\text{base}}=1/(6\pi)=\frac{4}{3}c_3</math> carries <math>q(A_3)</math>: <math>c_3/\varphi_{\text{base}}=3/4</math>. [E] <math>\delta_{\text{top}}=\Omega_{\text{adm}}c_3^4</math>. [E] the Quillen split holds at the <math>\alpha^{-1}=137.0359992</math> root. [E] NO NEW GATE: <math>\alpha^{-1}</math> stays [E]; v341 SHARPENS the pre-existing [O] origin EM.WARD.01 (no new <math>\alpha</math> problem). [O] the one still-open part IS EM.WARD.01’s residual: the from-first-principles AQFT PROOF that this is the EXACT Quillen determinant functional (the variational principle derived, not assembled). Sharpens v3/v48/EM.WARD.01 from “fixed point” to “stationarity of a named determinant line” [E][O]</p> |
| v342_em_ward_heatkernel.py   | <p>The heat-kernel sharpening of EM.WARD.01: DERIVES the ORIGIN and STRUCTURE of the <math>F_{U(1)}</math> determinant-line terms from textbook Seeley–DeWitt / Gilkey coefficients, advancing the EM-Ward origin from [C] to [E] for the STRUCTURE; NO new gate. [E] <math>c_3=1/(8\pi)</math> the boundary GAUSS–BONNET coefficient (seam = flat pillowcase <math>\chi=2</math>, <math>\oint K=4\pi</math>, v216). [E] the <math>\alpha^2</math> term is the GILKEY gauge-curvature coefficient: the <math>U(1)</math> Laplacian <math>a_4</math> has <math>30\Omega^2/360 = \frac{1}{12}\Omega^2</math> (Gilkey Thm 4.8.16), <math>\Omega=i\alpha F \Rightarrow -(\alpha^2/12)F^2</math>, so the Calderon <math>-2c_3^3\alpha^2</math> is the gauge-curvature piece, not an ansatz. [E] the <math>c_3</math>-ladder <math>\{0, 3, 6\}</math> is arithmetic (step <math>3 = 3</math> channels; <math>6= R^+(A_3) </math> <math>C_6</math> hexagon). [E] multiplicities forced (<math>2= \mathbb{Z}_2 </math>, <math>8b_1=(\text{rank } E_8)b_1</math>). [E] <math>\pi</math>-power test: <math>2c_3^3=1/(256\pi^3)</math> carries <math>\pi^3 \Rightarrow</math> THREE boundary insertions. [C] the exact coefficient needs the seam <math>F</math>-normalisation. [O] the cubic <math>\alpha^3</math> Maxwell moment + full identification = EM.WARD.01 residual (tied to SEAM.EQUIV.01). <math>\alpha^{-1}</math> stays [E] (v3) [E][C][O]</p>                                                                                                                                                                                                                                                                                                      |
| v343_four_routes_analysis.py | <p>The honest investigation of the four black-hole-birth solution routes (A finite causal diamond, B Carlip–Cardy near-horizon CFT, C modular/thermal flow, D self-reproduction attractor) – direct answer to “which closes ALL problems and is 100% provable”: NONE individually, but they CONVERGE on the same two irreducible residuals as v335 (SEAM.EQUIV.01 + the decoupled QG contour). [E] ROUTE A reframes QG.AMB to a FINITE thermal trace (de Sitter finite, gapped <math>\chi=729/665</math>) but <math>c_{\text{conf}}(4) = -3/2 &lt; 0</math> still needs the GHP contour (v334, [O]); does NOT touch SEAM.EQUIV.01. [C] ROUTE B: Carlip+Cardy consistent with <math>c=8</math> but <math>L_0</math> free (ambiguity) and gives <math>c</math> only, not holomorphy <math>\det K=1</math> – inherits SEAM.EQUIV.01. [E] ROUTE C: modular flow KMS <math>\beta=1</math> (v239), geometric identification = SEAM.EQUIV.01 (v335) – a reduction. [E]/[O] ROUTE D: unique Perron–Frobenius attractor (v56) but cyclic dynamics [O] – not a closure. [E] VERDICT: independent closures = 0; irreducible residuals = 2 (= v335); the BH premise makes both more natural but eliminates neither; focus = SEAM.EQUIV.01 [E][C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

*continued on next page*

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v344_detk_synthesis.py        | The bird's-eye synthesis of the ONE open keystone bit, $\det K=1$ – a full-spectrum map of SEAM.EQUIV.01's only open residual. [E] $\det K=1$ is ONE statement with SIX equivalent faces (holomorphy / homology-sphere link $H_1=0$ / one 1-dim irrep / $\det \text{Cartan} = 1$ / full $\mu_4$ condensation / $\tau=i$ CM), unified by $ \det \text{Cartan}  =  H_1(\text{link})  = \#(1\text{-dim irreps})$ across ADE ( $A_n \rightarrow n+1$ , $D_n \rightarrow 4$ , $E_6 \rightarrow 3$ , $E_7 \rightarrow 2$ , $E_8 \rightarrow 1$ ) – ONLY $E_8$ gives 1 ( $2I$ the unique PERFECT ADE group, v232/v219). [E] THE GENUS-1 OBSTRUCTION: the easy arguments (plane vacuum, gap, free-fermion) are genus-0, necessary but NOT sufficient (v87); $\det K$ is the torus degeneracy = #primaries. [E] THREE genus-1 access routes: R1 continuum-modular (v336), R2 anyon-condensation (v281), R3 hypergraph-homotopy. [C] the HYPERGRAPH route is the most promising fresh angle: the $(2, 3, 5)$ rewrite attractor IS the affine- $E_8$ graph (v312) and the $E_8$ du Val link is the Poincare sphere ( $H_1=0$ , v232), so $\det K=1$ becomes a finite COMBINATORIAL statement (no continuum limit). [O] none closes it; R3's combinatorial-to-geometric bridge is meanwhile discharged to Kronheimer 1989 (v479), so the residual transforms to “the raw seam supplies the ALE/orbifold datum” = the SEAM.EQUIV.01 content. A synthesis/roadmap; closes nothing [E][C][O] |
| v345_hypergraph_homotopy.py   | EXECUTE the combinatorial core of route R3 (the hypergraph-homotopy route to $\det K=1$ , v344): computes explicitly that the $(2, 3, 5)$ -rewrite attractor graph's plumbing link is the POINCARÉ homology sphere ( $H_1=0$ ), only $E_8$ among ADE; R3's combinatorial half is now [E]-complete, the geometric bridge (= SEAM.EQUIV.01) stays [O]. Plumbing topology (Brieskorn): link $H_1 = \text{coker}(\text{Cartan})$ . [E] $\text{SNF}(E_8 \text{ Cartan}) = \text{identity} \Rightarrow \text{coker}(E_8)=0 \Rightarrow$ the $E_8$ plumbing boundary is an INTEGRAL HOMOLOGY SPHERE (the genus-1 meaning of $\det E_8=1$ ). [E] only $E_8$ : $\text{coker}(A_n)=\mathbb{Z}/(n+1)$ , $D_n \rightarrow \mathbb{Z}/4$ , $E_6 \rightarrow \mathbb{Z}/3$ , $E_7 \rightarrow \mathbb{Z}/2$ – all nontrivial, only $E_8=0$ . [E] $\pi_1=2I=SL(2, 5)$ PERFECT (commutator subgroup order $120= G $ , computed) $\Rightarrow H_1=0 \Rightarrow$ THE Poincaré sphere; $ 2I =120= \mu_4  h(E_8)$ . [O] does NOT close $\det K=1$ : the graph $\rightarrow$ geometry half is meanwhile Kronheimer-cited (v479); what stays open is the raw seam supplying the ALE/orbifold datum = SEAM.EQUIV.01 [E][O]                                                                                                                                                                                                                                                                          |
| v346_seam_geometric_bridge.py | The geometric bridge as an explicit six-link chain raw-seam $\Rightarrow \det K=1$ , with the ONE open arrow pinned – the honest capstone of the SEAM.EQUIV.01 investigation. L1 [E]/[C] raw seam $\rightarrow \mu_4$ + four marks (v216); L2 [O] $\mu_4$ + $(2, 3, 5)$ atoms $\rightarrow 2I$ orbifold $\mathbb{C}^2/\Gamma$ (THE OPEN ARROW = SEAM.EQUIV.01); L3 [E] $2I \rightarrow$ affine $E_8$ McKay (v219); L4 [E] $2I \rightarrow E_8$ du Val (v232); L5 [E] $\mathbb{C}^2/2I \rightarrow$ Poincaré link $H_1=0$ (v345); L6 [E] $H_1=0 \rightarrow \det K=1$ . [E] 5 of 6 links are theorems, only L2 open. [E] the group is FORCED by the seam atoms: axis signatures $(2, 3, 3)/(2, 3, 4)/(2, 3, 5) \rightarrow 2T/2O/2I$ , $(2, 3, 5)$ unique to $2I$ , and $( \mathbb{Z}_2 , N_{\text{fam}}, g_{\text{car}})=(2, 3, 5)$ ARE those axes. [E] downstream of L2 forced. [O] L2 (the seam IS an ADE orbifold point) = SEAM.EQUIV.01, NOT closed – the keystone reduced to one geometric-realisation arrow, group pinned by $(2, 3, 5)$ [E][C][O]                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v347_seam_closure_modes.py    | The closure-mode classification of the one open arrow L2 (the seam-orbifold realisation, v346) – a direct honest answer to “is there ANY other way to FULLY solve it?”. [E] THE PRECISE LOCUS: the seam gives the pillowcase base $S^2(2, 2, 2)$ , $\chi_{\text{orb}}=0$ (EUCLIDEAN, v216), but the $2I/E_8$ structure is the Seifert base $S^2(2, 3, 5)$ , $\chi_{\text{orb}}=1/30$ (SPHERICAL); L2 must bridge a FLAT 4-marked base to a SPHERICAL 3-marked base – why L2 needs the carrier $(2, 3, 5)$ input. [E] FOUR CLOSURE MODES: A construct (the analytic wall, v336); B rigidity (unique realisation $\Rightarrow \mathbb{C}^2/2I$ forced, the only theorem-route w/o new input, v284/v300/v331); C axiom $P_3$ ( $\Rightarrow$ TFPT complete rel. 3 axioms); D empirical. [E] no-new-state (v246) blocks deriving L2 from extra physics $\Rightarrow$ only rigidity (B) closes it as a theorem. [E] VERDICT: no free theorem; only B (theorem) or C (axiom), validated by D; only these four modes. [O] NOT closed [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Script                                  | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v348_seam_rigidity_route.py             | Route B (the rigidity route) for the one open arrow L2, carried out – it lands on a strikingly SIMPLE statement: the whole keystone reduces to ONE question, does the raw seam carry the golden ratio? [E] rigidity closes the crystallographic part: the order-4 clock has a UNIQUE normal form $z \mapsto iz$ (Nielsen/Kerckhoff, v180), Troyanov gives the unique flat pillowcase metric (v284). [E] downstream is a LATTICE identity: $E_8$ = the ring of icosians (Conway–Sloane), rank 8, so $2I \rightarrow E_8$ is a lattice identity (stronger than McKay v219). [E] the single bridge is $\varphi$ : crystallographic orders $\{1, 2, 3, 4, 6\}$ , the 5-fold non-crystallographic; $\mu_4$ crystallographic, $2I$ (5-fold) not, $\varphi = 2\cos(\pi/5)$ extends one to the other (quasicrystal). [O] the keystone reduces to ONE question: “does the raw seam carry $\varphi$ ?” – if yes, $\mu_4 + \varphi \rightarrow 2I \rightarrow E_8$ closes L2. [O] honest subtlety: TFPT’s $\varphi$ is currently $E_8$ -side (v312/v313); the raw-seam data (cusp $\{0, 1/3, 2/3\}$ , recovery $(2/3)^6$ , seed $\varphi_0$ ) are not manifestly golden, so showing the RAW seam carries $\varphi$ non-circularly is the residual (= L2). NOT closed [E][O] |
| v349_raw_seam_golden_test.py            | The honest test of the v348 question “does the RAW seam carry the golden ratio (before assuming $E_8$ )?”. Answer, computed: NO – the bare carrier ( $D_5$ , $A_3$ ) and the dynamical seam data are NOT golden; the golden ratio genuinely enters WITH the icosahedral/ $E_8$ identification. A NEGATIVE result that prevents a false closure. [E] RAW CARRIER NOT GOLDEN: golden needs $5 \mid h$ ; $D_5$ has $h=8$ ( $2\cos(2\pi/8)=\sqrt{2}$ ), $A_3$ has $h=4$ – no 5-fold, bare carrier gives $\sqrt{2}$ . [E] DYNAMICAL DATA NOT GOLDEN: cusp $\{0, 1/3, 2/3\}$ rational, recovery $(2/3)^6$ rational, seed $\varphi_0$ transcendental. [E] GOLDEN IS THE ICOSAHEDRAL/ $E_8$ SIDE: $5 \mid h$ only for $A_4=SU(5)$ ( $h=5$ ), $H_3$ ( $h=10$ ), $E_8$ ( $h=30$ ). [E] $\varphi$ alone insufficient: $2I \neq C_5 \times \mu_4$ ( $20 \neq 120$ ). [O] RESOLUTION: L2 reduces to “is $g_{\text{car}}=5$ a PENTAGON (5-fold $\Rightarrow$ golden $\Rightarrow$ icosahedral) or a COUNT (rank $D_5 \Rightarrow \sqrt{2}$ )?” – the golden ratio is the pentagon-reading of P2, NOT derivable from P2-as-a-count; no hidden $\varphi$ . Foundational: P2-as-pentagon closes it (mode C) else rigidity must produce the 5-fold (mode B); NOT closed [E][O]     |
| v350_bootstrap_inputs_correction.py     | The honest CORRECTION of v349’s framing (prompted by the right objection: the inputs are not axioms, they are back-determined by the theory). [E] THE INPUTS ARE BOOTSTRAP-FORCED, NOT FREE AXIOMS (v6): $g_{\text{car}}=5$ over-determined three ways (rank-fill, Coxeter-match $g_{\text{car}} = \max$ prime of $h(E_8)=30$ , Pascal). [E] $g_{\text{car}}=5$ IS THE ICOSAHEDRAL 5-FOLD, not the $D_5$ rank: $g_{\text{car}} = \max$ prime of $h(E_8)=30=2\cdot 3\cdot 5$ ; the atoms (2, 3, 5) ARE the primes of the icosahedral Coxeter number 30. [E] THE GOLDEN RATIO IS EMERGENT FROM THE GLUE, not external: $D_5$ ( $h=8$ )/ $A_3$ ( $h=4$ ) non-golden alone, but the $\mu_4$ extension $D_5 \oplus A_3 \rightarrow E_8$ (v154) gives $h(E_8)=30$ (golden, $5 \mid 30$ ) – the seam’s own $\mu_4$ produces the 5-fold; v349 checked the un-glued pieces, the wrong object. [E] v349’s pentagon-vs-count dichotomy was FALSE (the bootstrap forces the pentagon). [O] residual relocates: the golden is bootstrap-forced; the only open thing is the physical continuum realisation (v336), NOT the golden ratio. Caveat: self-consistency within the framework, not from-nothing. Supersedes v349’s interpretation [E][O]                              |
| v351_continuum_realisation_sharpened.py | The continuum realisation sharpened – the “ $c=8$ ambiguity” flagged open in v277/v344 ( $E_8$ vs $SO(16)$ both $c=8$ ) is RESOLVED, non-circularly, by the seam’s ORDER-4 $\mu_4$ clock. [E] $E_8$ (det 1, holomorphic) vs $D_8=SO(16)$ (det 4). [E] the order-4 clock (the four Gauss–Bonnet marks, $ \mu_4 =4=h(A_3)$ , v216): index-4 extension $D_5 \oplus A_3 = E_8$ (v154), index-2 = $SO(16)$ ; so order-4 selects $E_8$ ( $16 \rightarrow 4 \rightarrow 1$ ) not $SO(16)$ ( $16 \rightarrow 4$ ) – the order (4 not 2) is the discriminator. [E] bootstrap agrees: $h(E_8)=30$ (max prime 5) vs $h(D_8)=14$ (max prime 7). [E] which-net ambiguity RESOLVED (det $K=1$ is then a consequence). [O] residual = PURELY the chiral-edge/scaling-limit existence (bulk-edge, v336), net+holomorphy pinned. Does NOT close SEAM.EQUIV.01 [E][O]                                                                                                                                                                                                                                                                                                                                                                                                              |

*continued on next page*

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v352_framework_irreducible.py | The framework reduction – the deepest answer to “the inputs are not axioms, they are back-determined”. [E] P2 ( $g_{\text{car}}=5$ ) FORCED three ways (v6): rank-fill, Coxeter-match ( $g_{\text{car}} = \max \text{ prime of } h(E_8)=30$ ), Pascal. [E] P1 ( $c_3=1/(8\pi)$ ) FORCED: $c_3$ is the boundary Gauss–Bonnet coefficient (v216/v342), the 8 over-determined four ways ( $8 = \text{rank } E_8 = h(D_5) = \phi(30) = \det R$ , v54/v6); only $\pi$ is non-forced (the boundary transcendental). [E] the $E_8$ hull is forced (unique even unimodular rank-8, v83/v154). [E] so the ONLY irreducibles are the FRAMEWORK (a discrete reflection-positive boundary with a finite Clifford carrier) + $\pi$ – the precise content of “the inputs are not axioms”. [O] the framework is the META-AXIOM (not math-reducible, the foundational stance, tested by its consequences not proved). TFPT’s true input is ONE framework + $\pi$ [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v353_selfloop_capstone.py     | The bird’s-eye rethink (refining v352): TFPT is not a LINEAR theory (axioms $\rightarrow$ theorems) but a CLOSED SELF-CONSISTENT LOOP whose outputs fix its own inputs, with ZERO free adjustable dimensionless parameters. [E] IT IS A LOOP: outputs fix inputs ( $g_{\text{car}}=5 = \max \text{ prime of } h(E_8)=30$ ; the 8 in $c_3 = \text{rank } E_8$ ) and inputs fix outputs; the arrows close into a circle (v6) with a unique fixed point (v56). [E] ZERO FREE DIALS: every load-bearing number is forced/over-determined; free dimensionless parameters = 0. [E] $\pi$ is a FIXED geometric constant (the boundary 2-sphere, $\oint K=4\pi \Rightarrow c_3=1/(8\pi)$ ), not a dial. [C] refining v352: $\pi$ is not a free input and the framework is a SELECTION PRINCIPLE (the unique self-consistent loop), not a free meta-axiom. [O] the one residual is the CONTINUUM closure (the chiral-edge existence, v336/v351); structural-realism (loop complete) vs constructivism (continuum open) is a philosophical, not numerical, fork [E][C][O]                                                                                                                                                                                                                                                                                                                                              |
| v354_e8_reverse_audit.py      | The REVERSE numerology audit + what the golden ratio means. The forward rule (v305) is one-directional (every readout must map onto $E_8$ ); the reverse question: how much $E_8$ structure maps onto NOTHING? [E] $E_8$ has 8 Casimir invariant degrees $\{2, 8, 12, 14, 18, 20, 24, 30\}$ ; THREE feed a readout (2 metric, 8 rank $\rightarrow c_3$ , 30 Coxeter $\rightarrow g_{\text{car}}$ ) and FIVE are UNMAPPED $\{12, 14, 18, 20, 24\} - 3/8$ load-bearing, $5/8$ not. [E] ECONOMY, NOT PROMISCUITY: a small fixed set (rank 8, $h=30$ , $\det 1$ , $D_5 \oplus A_3$ , 16-spinor) generates ALL readouts; the higher Casimirs are never reached into to fit – the anti-numerology signature (economy + a large untouched remainder). [E] the golden ratio is UNMAPPED (the affine- $E_8$ attractor eigenvalue v312, the icosian lattice v348; no frozen readout is $\varphi$ , the sole [C] exception $\cos(\theta_i=3\pi/5)=-1/(2\varphi)$ on the axion spine branch, refined in v429) $\Rightarrow$ NOT numerology (which needs a number fitted to an observation); $\varphi$ is the algebraic signature of the 5-fold $h=30=2\cdot 3\cdot 5$ , the carrier announcing it is icosahedral. [O] the $5/8$ unmapped is the HULL OVERHEAD ( $E_8 = \text{minimal unimodular hull, not the world group}$ ); where future readouts could live, or over-capacity. The reverse complement of v305 [E][O] |
| v355_e8_unmapped_bandwidth.py | A disciplined bandwidth search of the unmapped $E_8$ region (next step after v354), run with a STRICT discriminator: a candidate counts only if it is a FORCED identity (a theorem about $E_8$ ), never a numerical coincidence – because mining a rich object for matches is the numerology temptation. [E] FORCED SET-LEVEL (the real collective content): $\sum \text{deg} = 128 = \dim S^+$ the spinor half of $248=120+128$ ; $\sum \text{exp} = 120 = \# \text{pos roots}$ ; $\prod \text{deg} =  W(E_8) $ ; exponents = the $\varphi(30)=8$ totatives of 30 (v223); $\max \text{deg} = 30 = h(E_8)$ . [C] SUGGESTIVE not forced: $12=h(E_6)$ , $18=h(E_7)$ , $30=h(E_8)$ (the McKay ladder v219), but ‘deg( $E_8$ ) contains subalgebra Coxeter numbers’ is not a theorem – flagged. [O] DECLINED: the per-degree atom matches ( $14=\dim G_2$ , $20=\det L$ , $24= W(A_3) $ , $12= R(A_3) $ , $18=p_4(a)$ ; v66 flagged 12, 18 fittable) each admit multiple readings, and the $ W $ prime 7=‘scalaron exponent’ is one of many – declined. [E] RECONCILES v66 (degrees=atoms) and v354 (only 2, 8, 30 primary): NO new forced physical hit; the disciplined decline IS the anti-numerology result [E][C][O]                                                                                                                                                                                         |

| Script                                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v356_<br>continuum_mmst_<br>applicability.py | Direction A: the continuum chain of SEAM.EQUIV.01 assembled theorem-by-theorem, residual reduced to ONE lattice-realization input tied to the seam's one-sidedness. Chain: gapped (v302) quasi-free 16-Majorana collar (v155/v160) $\rightarrow$ invertible (Kitaev, v301) $\rightarrow$ the NONTRIVIAL invertible phase ( $c_-=8$ ) $\rightarrow$ a non-gappable anomalous chiral edge (anomaly inflow: edge EXISTENCE follows, reducing the v336/v351 'does the edge exist?' residual) $\rightarrow$ chiral-CFT scaling limit (MMST v336, $8 \leq 8 \leq 16$ ) $\rightarrow$ order-4 $\mu_4$ clock + AQFT stack pin $(E_8)_1$ (v351/v297). The only non-theorem link is the seam one-sidedness = the $c_3$ origin ( $c_- \neq 0$ = one-sided = the $ \mathbb{Z}_2  \nmid K=8$ of $c_3=1/(8\pi)$ , v58). [C]/[E]/[O]; ADVANCES SEAM.EQUIV.01 to one realization input, does not close. (Direction B was found already closed by v40.) [C][E][O]                                                                                                                                      |
| v358_grav_entropy_<br>equilibrium.py         | The entanglement-equilibrium derivation (Jacobson 2015 / Faulkner et al., $\delta S = \delta \langle K \rangle$ ) with TFPT's atoms $\Rightarrow$ the LINEARISED Einstein equation falls out PARAMETER-FREE. [E] $G_{ab} = (1/c_3)T_{ab}$ , $1/c_3 = 8\pi$ fixed (Unruh $1/(2\pi)=4c_3$ , EH $1/(16\pi)=c_3/2$ , Einstein $8\pi=1/c_3$ , Bekenstein $1/4=1/ \mu_4 $ ). [E] THERMO=GEO coincidence (new): the first law's $2\pi/\eta$ = the geometric $ \mathbb{Z}_2 2\pi\chi$ iff $ \mu_4 = \mathbb{Z}_2 \chi=4$ – the thermodynamic and geometric origins of $c_3$ are ONE. [C] J3 solved: the CHM ball modular Hamiltonian (boost via BW v323) gives the matter flux $\delta \langle K_B \rangle = \frac{8\pi^2 R^4}{15} \delta \langle T_{00} \rangle$ . [E] entropy density atom-fixed: $1/4=1/ \mu_4 $ + central charge $c=g_{\text{car}}+N_{\text{fam}}=8$ (form v59). [O] residual: the equation-of-state status + the global ambient measure (C7) + the $v_{\text{geo}}$ unit (v359 closes the FULL covariant equation); no free dimensionless gravity dial remains [E][C][O] |
| v359_grav_<br>nonlinear_<br>einstein.py      | The FULL covariant Einstein equation, parameter-free (Direction 1, extends v358). The Jacobson-2015 fixed-VOLUME entanglement equilibrium brings in the EINSTEIN TENSOR $G_{ab}$ (not just $R_{ab}$ ) – the unique divergence-free metric tensor (Lovelock) – so equilibrium yields the full covariant $G_{ab} + \Lambda g_{ab} = c_3^{-1}T_{ab}$ with conservation built in. [C][E] fixed-volume $\rightarrow$ Einstein tensor (trace = $-R$ in $d=4$ ). [E] Lovelock $\Rightarrow \nabla^a T_{ab}=0$ is an output. [E] coeff 1: $8\pi=1/c_3$ fixed (v358). [E] coeff 2: $\Lambda$ from $\alpha - \rho_\Lambda/\bar{M}_{\text{Pl}}^4 = (3/(4\pi^2))e^{-2\alpha^{-1}}$ , prefactor $(8\pi)^2 \cdot 48c_3^4 = 3/(4\pi^2)$ (v60); BOTH coefficients TFPT-fixed. RESULT: the original B6 full covariant field equation is now parameter-free at the LOCAL level. [O] residual: the equation-of-state status + the global ambient measure (C7) [E][C][O]                                                                                                                                  |
| v360_grav_gap_<br>corrections.py             | Direction 2: the gap-induced higher-curvature correction to GR – the disciplined result. Does the seam transfer gap give a NEW forced near-term GR-deviation beyond the known $R^2$ scalaron? With the v354/v355 discriminator: NO. [E] the leading higher-curvature term IS the $R^2$ scalaron ( $a_4=R^2/72$ v36; $M_{\text{scal}}^2/M_{\text{Pl}}^2 = c_3^7$ , $\exp 7=g+N-1$ ) – already in TFPT, already falsifiable via $n_s=1-2/N_*$ , $r=12/N_*^2$ (CMB-S4). [C] it is the entanglement-equilibrium next order (Wald first law $\rightarrow f(R)=R+R^2$ , v28/v359). [E] the gap $\Delta=6\ln(3/2)$ is dimensionless, so a distinct gap term sits at $\xi v_{\text{geo}} \sim$ seam/Planck scale, not near-term observable. [O] DECLINE: a new dimensionless coefficient is not atom-forced (needs heat-kernel/Wald data; $\exp 7$ vs $6$ , $c_3^7$ vs $(2/3)^6$ unrelated) $\rightarrow$ per v354/v355 declined. No new near-term forced prediction; the answer is the scalaron [E][C][O]                                                                                    |
| v361_grav_<br>backreaction.py                | Direction 5: the matter-gravity backreaction with the explicit J3 flux – two forced facts + an honest decline. [E] the carrier's gravitational anomaly is FORCED: $c_-=8$ (16 Majoranas = $\dim S^+ = 2^{g_{\text{car}}-1}$ ; chiral central charge $16/2=8=g_{\text{car}}+N_{\text{fam}}$ , the same $c_-$ as v358). [E] the backreaction is FINITE $\rightarrow \Lambda$ from $\alpha$ : the matter vacuum energy through $G_{ab}=c_3^{-1}T_{ab}$ is gap-suppressed (Decoupling Thm v337) to $\rho_\Lambda/\bar{M}_{\text{Pl}}^4 = (3/(4\pi^2))e^{-2\alpha^{-1}}$ (v60), 123 orders = $119.03+3.92$ – NOT the $M_{\text{Pl}}^4$ catastrophe; the loop (v359+v60+carrier vacuum) closes. [E] J3 explicit (v358): $\delta \langle K_B \rangle = (8\pi^2 R^4/15)\delta \langle T_{00} \rangle$ , carrier $T_{ab}$ =the SM's (v159). [C] SM trace anomaly reproduced (content=SM). [O] DECLINE: no new atom-forced read-out of individual SM quantum numbers beyond $c_-=8$ and $\Lambda \rightarrow$ per v354/v355 declined. Finite & consistent backreaction, no new dial [E][C][O]   |

| Script                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v364_vgeo_sharpen.py      | Direction 6: $v_{\text{geo}}$ is the SINGLE dimensionful input of the WHOLE theory – confirmed across matter AND gravity – and irreducibly primitive. The No-Unit Theorem (v153) showed the dimensionless compiler cannot output a scale ( $v_{\text{geo}}$ a forced unit). SHARPENING after the parameter-free gravity (v358/v359/v361): the gravity sector adds NO new scale either $-1/c_3=8\pi$ and the $\Lambda$ prefactor $(8\pi)^2 \cdot 48c_3^4 = 3/(4\pi^2)$ are dimensionless, so $1/G \sim v_{\text{geo}}^2$ and $\Lambda \sim (\text{dimensionless})v_{\text{geo}}^4$ reduce to $v_{\text{geo}}$ times atoms. [E] FINAL TALLY: every dimensionful quantity = (dimensionless ratio) $\times$ (power of $v_{\text{geo}}$ ); free content = $\{v_{\text{geo}}, \pi\}$ , ZERO dimensionless dials, vs the SM's $\sim 26$ . [O] $v_{\text{geo}}$ irreducibly primitive (No-Unit; $1/G$ UV-sensitive Sakharov v68). Clarity, not a new derivation; the last dimensionful anchor named [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| v365_qg_oneloop_saddle.py | Direction 3: the QG measure (gate C7/QG.AMB.01) as one-loop GAUSSIAN fluctuations around the PARAMETER-FREE saddle (v358/v359). [E] the fluctuation stiffness is $1/c_3 = 8\pi$ (no free dial), so the one-loop problem is well-posed (it was NOT before v358). [E] the fluctuation operator is gapped $M \geq \Delta_{\text{eff}} = 6 \log \frac{3}{2} - \frac{31}{4\pi^2} \approx 1.648 > 0$ (v76/v337) $\Rightarrow$ mode-by-mode Gaussian convergence. [E] finite model log-det $\text{Tr}' \log M = 6 \log \frac{9}{2}$ on the OS spectrum $\{0, 6 \log \frac{3}{2}, 6 \log 3\}$ . [C] the conformal mode converges on the GHP contour $(\int e^{- c \phi^2} = \sqrt{2\pi/3}, \text{v334})$ . [E] the admissible projective limit exists $(\chi = 1/(1 - (2/3)^6) = 729/665, \text{v330})$ . [E] 0 new dimensionless dials (v364). [O] residual: the full non-perturbative projective limit (G6/QG.AMB.01) on the ambient sector. Sharpens C7 to a one-loop Gaussian problem around a parameter-free saddle; does NOT close it. [E][C][O]                                                                                                                                                                                                                                                                                                                                                                                           |
| v366_mmst_seam_collar.py  | Direction 7: the seam collar is IN MMST's free-lattice-fermion scaling-limit class, so the chiral scaling limit is a chiral CFT of central charge 8 pinned to $(E_8)_1$ – reducing SEAM.EQUIV.01 to the single S3 lattice-realisation input. Osborne–Stottmeister (arXiv:2107.13834, CMP <b>398</b> (2023) 219; legacy internal token MMST, on the MMST/Morinelli–Morsella–Stottmeister–Tanimoto OAR framework): free lattice fermions (CAR quasi-free) $\rightarrow$ chiral-CFT massless scaling limit with correct $c$ , range $\text{rank} \leq c \leq D$ . [E] class arithmetic: $D = \dim S^+ = 2^{g_{\text{car}}-1} = 16$ Majoranas, $c = g_{\text{car}} + N_{\text{fam}} = 8$ , $\text{rank } E_8 = 8 \Rightarrow \text{rank} \leq c \leq D$ is $8 \leq 8 \leq 16$ (in MMST range). [E] gapped ( $\Delta = 6 \log \frac{3}{2} > 0$ , derived v302). [C] quasi-free CAR class (v155/v160). [E] chirality $c_- = D/2 = 8 \neq 0$ (non-gappable anomalous edge, v356 S4). [C] the MMST scaling-limit theorem applies (in-class & gapped & chiral & in-range) $\Rightarrow$ chiral CFT $c=8$ (v336). [E] target pinned to $(E_8)_1$ by $c=8$ + the order-4 $\mu_4$ clock ( $\det K=1$ vs $SO(16) \det K=4$ , v351). [O] residual S3: the collar realised as a genuine lattice chiral free-fermion invertible phase (one-sidedness/Flat-Away, v297/v356). Verifies MMST in-class; ADVANCES SEAM.EQUIV.01, does NOT close it. [E][C][O] |
| v367_seam_s3_lattice.py   | Track 1: the EXPLICIT lattice realisation of the S3 input – a concrete gapped chiral-Majorana ( $p + ip$ ) lattice model whose edge is the 16-Majorana $SO(16)_1$ carrier, $\mu_4$ -condensed to $(E_8)_1$ ; turns the abstract S3 residual (v356/v366) into a RUNNABLE model with a numerically computed topological invariant. [E] bulk gapped (band gap $2 > 0$ at $M=1$ ). [E] non-trivial Chern number (Fukui–Hatsugai–Suzuki: $ C =1$ at $M=1$ , $C=0$ at $M=3$ trivial control). [E] $c_- = 8$ : each chiral Majorana edge carries $c_- = C/2 = 1/2$ , $N_{\text{Maj}} = \dim S^+ = 2^{g_{\text{car}}-1} = 16$ copies $\Rightarrow c_- = 16/2 = 8 = g_{\text{car}} + N_{\text{fam}}$ . [E] edge K-matrix $SO(16)_1$ ( $\det \text{Cartan } D_8=4$ ) $\rightarrow (E_8)_1$ ( $\det \text{Cartan } E_8=1$ ) by the order-4 $\mu_4$ clock (v351/v369). [C] the $\mu_4$ condensation $SO(16)_1 \rightarrow (E_8)_1$ (v154/v351). [O] residual: the continuum scaling-limit existence (MMST v336). Reduces S3 to a runnable lattice model; does NOT close SEAM.EQUIV.01. [E][C][O]                                                                                                                                                                                                                                                                                                                                                     |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v368_seam_s3_inflow.py       | Track 1: the bulk-edge / anomaly-inflow leg (S4 of the v356 chain) made CONCRETE on the v367 lattice model – a finite STRIP of the gapped $p + ip$ model has a realised, non-gappable chiral edge, so edge EXISTENCE follows from the invertible bulk (anomaly inflow), NOT a separate assumption. [E] topo in-gap edge states ( $M=1$ strip $\min_{k_x}  E  \sim 0$ ) vs trivial clean gap ( $M=3$ , neg control); [E] the near-zero state is edge-localised (weight within 4 sites of a boundary, edge $\gg$ bulk); [E] bulk-edge correspondence (edge branch count = bulk Chern $ C =1$ ) $\Rightarrow$ 16-Majorana edge, $c_- = 8$ . [C] anomaly inflow: a $c_- \neq 0$ invertible bulk cannot have a gappable edge $\Rightarrow$ discharges the v336/v351 ‘does the edge exist?’ residual on the lattice. [O] residual: the continuum scaling limit (MMST v336). Establishes edge EXISTENCE on the lattice; does NOT close SEAM.EQUIV.01. [E][C][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| v369_qgamb_redundancy.py     | Track 2 (next-plan v2): the AMBIENT REDUNDANCY statement – the holographic route to Gravity-complete that SIDESTEPS building the general Euclidean QG measure (C7/QG.AMB.01). Instead of constructing the non-perturbative ambient measure (the conformal-factor swamp, v332/v334), assemble the established discriminators proving the ambient sector carries NO physical d.o.f. relative to the holomorphic boundary algebra, so QG.AMB.01 is a non-fundamental CERTIFICATION object (like a coordinate choice in GR), not missing dynamics. [E] HOLOMORPHIC $\Rightarrow$ DHR = Vec: #DHR primaries = $ \det \text{Cartan}  = 1$ for $E_8$ (ONE primary = vacuum) vs 4 for $SO(16)/D_8$ – no nontrivial superselection charges $\Rightarrow$ no hidden boundary sector a bulk could carry invisibly. [E] NO TORUS GSD: ground-state degeneracy on $T^2 = \#\text{anyons} =  \det K  = 1$ for $E_8 \Rightarrow$ unique ground state $\Rightarrow$ no topologically protected invisible bulk d.o.f. (the genus-1 obstruction of v344). [E] FINITE PETZ RECOVERY: the deviation subspace contracts at $(2/3)^6 = 64/729 < 1$ (v221) $\Rightarrow$ $\text{Rec}_\Sigma$ bounded. [E] GAP-DECOUPLING MARGIN: $\Delta_{\text{eff}} = 6 \log \frac{3}{2} - \frac{31}{4\pi^2} \approx 1.648 > 0$ (v76/v337) $\Rightarrow$ the ambient sector is energetically separated. [C] RECONSTRUCTION MAP: Bisognano–Wichmann gives the modular boost (v258/v309/v323) $\Rightarrow \text{Rec}_\Sigma : (\text{bulk}) \rightarrow \mathcal{A}_\Sigma^{\mu_4}$ . [C] THE REDUNDANCY STATEMENT: under SEAM.EQUIV.01 + BW, $\mathcal{O}_{\text{phys}}^{\text{bulk}}/\text{Diff} \cong \mathcal{A}_\Sigma^{\mu_4} \Rightarrow$ QG.AMB.01 carries no extra physical d.o.f. [O] residual: the two consumed premises – SEAM.EQUIV.01 (the S3 lattice input, v366) + the BW intrinsicity of the raw collar (v329); provides the ALTERNATIVE (holographic) route, does NOT construct the measure. Gravity-complete = Boundary-complete + Ambient-redundancy [E][C][O] |
| v370_grav_spin2_unitarity.py | Track 2: the Barnes–Rivers spin decomposition of the graviton propagator – perturbative graviton unitarity SECTOR-BY-SECTOR (extends v304’s scalar pole algebra to the tensor spin structure + combines with v334’s spin-0 conformal mode). [E] projector completeness: $\text{tr } P_2 = (d-2)(d+1)/2$ , $\text{tr } P_1 = d-1$ , $\text{tr } P_{0s} = \text{tr } P_{0w} = 1$ sum to $d(d+1)/2$ ; the $d=4$ split is $5+3+1+1=10$ . [E] EH structure: spin-2 coefficient +1, spin-0 scalar $-1/(d-2) = -1/2$ . [E] the Stelle ghost is a SPIN-2 state (a local $1+p^2/M^2$ dressing puts the negative-residue pole at $p^2 = -M^2$ ). [E] the entire KMS form factor $e^{p^2/M^2}$ (v304/v259) makes spin-2 ghost-free (only the $p^2=0$ pole). [C] the wrong-sign spin-0 conformal mode ( $c_{\text{conf}}(4) = -3/2$ , v332) is cured by the GHP contour (v334) – a different mechanism. [C] $\Rightarrow$ perturbative graviton unitarity sector-by-sector, conditional on v304’s entire-analyticity assumption. [O] perturbative-only + the open analyticity assumption; NOT the non-perturbative measure (QG.AMB.01). [O] decline: $\text{tr } P_2 = 5$ is dimension counting, NOT $g_{\text{car}}$ (v354/v355). [E][C][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

*continued on next page*

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v371_ftransfer_pole.py        | Track 3 ( $F_{\text{transfer}}$ ): the Koide source→pole transfer as a typed solver – promotes the <b>experiments/ftransfer</b> solve into the ledger with a kill test (does NOT re-prove 53/54 v183 or $Q^*=2/3$ v82/v101). [E] $Q_{\text{pole}}=\text{Koide(PDG poles)}=2/3$ to $3\times 10^{-6}$ , $Q_{\text{src}}(\varphi_0^{\text{ret-ladder}})=0.66446$ (0.33% below). [E] QED runs the wrong way: $dQ/d\epsilon > 0$ pushes $Q$ ABOVE 2/3; the $\epsilon$ mapping $Q_{\text{pole}} \rightarrow Q_{\text{src}}$ is NEGATIVE while QED gives $\epsilon=+(3/2)(\alpha/\pi) > 0$ – wrong sign for any $\alpha \in [1/137, 1/128]$ . [C] verdict: $F_{\text{pole}}$ is NOT standard QED running; the transfer is the non-QED 53/54 operator / $(2/3)^6$ Moebius generator (v183/v82). Stays [C], plain running excluded as the kill. [E][C]                                                                                                                                                                                   |
| v372_ftransfer_boltzmann.py   | Track 3 ( $F_{\text{transfer}}$ ): $\eta_B$ from the INTEGRATED Buchmueller–Di Bari–Pluemacher Boltzmann network at the TFPT-frozen heavy scale – promotes the <b>experiments/ftransfer</b> solve, replacing the v326 toy washout. Frozen $M_1=M_{\text{scal}}(\varphi_0^{\text{ret}})^2/A_\Lambda$ ( $\sim 8.65\times 10^9$ GeV, v212), $\tilde{m}_1=m_3/A_\Lambda=5$ meV, $\delta_{CP}=4\pi/3$ . [E] integrated efficiency $\kappa_f \sim 0.09$ (strong washout $K \sim 4.6$ ) agrees with the BDP fit to $\sim 25\%$ . [C] $\eta_B(\text{ODE}) \sim 6.5\times 10^{-10}$ at the frozen $M_1$ lands within a factor $\sim 1.1$ of the observed $6.1\times 10^{-10}$ , NO $M_R$ dial. [X] kill: $\eta_B$ outside [obs/3, 3 obs] for all seesaw-consistent $M_R$ would drop the leptogenesis branch. Stays [C] (a transfer target). [E][C][X]                                                                                                                                                                                    |
| v373_ftransfer_relic.py       | Track 3 ( $F_{\text{transfer}}$ ): the axion relic from the FINITE-T misalignment ODE – promotes the <b>experiments/ftransfer</b> solve and DECIDES the two TFPT angle branches, replacing the v326 adiabatic toy. $f_a=M_{\text{scal}}/128 \sim 2.4\times 10^{11}$ GeV, $m_a \sim 23.8 \mu\text{eV}$ , lattice $\chi(T)$ $n=8.16$ . [E] candidate scales fixed by the determinant-line atoms ( $128=2 \dim S^+ \mu_4 $ ). [C] the frozen SPINE angle $3\pi/5=108^\circ=\pi N_{\text{fam}}/g_{\text{car}}$ gives $\Omega_a h^2 \sim 0.12$ in $[0.08, 0.16]$ (lands on $\Omega_{\text{DM}}$ untuned) – the robust dominant-DM branch. [X] the HILLTOP $170^\circ$ over-produces ( $\sim 5.4\times$ ) – disfavoured. [X] kill: a finite-T solve robustly outside $[0.08, 0.16]$ for the spine across $\chi(T)/g_*$ drops the dominant axion-DM branch. Stays [C]/[X]. [E][C][X]                                                                                                                                                   |
| v374_ftransfer_qcd.py         | Track 3 ( $F_{\text{transfer}}$ ): the $m_p/m_e$ transfer as a typed uncertainty-budget + kill test – the falsifiability companion to v262 (the precise 2-loop point), replacing the v326 toy (which hardcodes 1836.15). [E] $b_3 = -(11 - 2n_f/3) = -7$ ( $n_f=6$ carrier). [C] two declared externals (v339): $\alpha_s(M_Z)=0.1179\pm 0.0009$ and $C_p=2.83\pm 0.15$ , each $\sim 5.3\%$ . [C] $m_p/m_e$ central $\sim 1824$ (v262) with a propagated $\pm 7.5\%$ band [ $\sim 1690, \sim 1960$ ] CONTAINING the observed 1836.15 – no free dial. [X] kill: a future lattice $C_p\pm 0.03$ + tighter $\alpha_s$ shrink the band to $\sim \pm 2\%$ ; a band then excluding 1836.15 drops the QCD-matching route ( $b_3 = -7$ + the $SU(9)$ -integer firewall v262). Distinct from v262's point; stays [C]. [E][C][X]                                                                                                                                                                                                          |
| v375_observatory_registry.py  | Track 4: the prediction OBSERVATORY – a status-typed CI over the frozen prediction registry ( <b>freeze_file.csv</b> ) that makes the falsifiability surface machine-checkable (no new physics). [E] falsifiability complete: every registry row carries a non-empty kill criterion (no orphan claims). [E] headline values re-derive from $\{\varphi_0^{\text{ret}}\}$ : $\sin^2 \theta_{12}=1/3-\varphi_0^{\text{ret}}/2$ , $\sin^2 \theta_{13}=\varphi_0^{\text{ret}} e^{-5/6}$ , $\beta_{\text{rad}}=\varphi_0^{\text{ret}}/(4\pi)$ . [C] live scorecard: $\theta_{12}$ vs JUNO first run ( $0.3092\pm 0.0087$ ) = $0.28\sigma$ (compatible); $\theta_{13}$ vs NuFIT 6.0 NO ( $0.02195\pm 0.00058$ ) = $2.0\sigma$ (the flagged most-tensioned core prediction); $\beta_{\text{rad}}$ vs ACT DR6 ( $0.215\pm 0.074$ ) = $0.37\sigma$ (hint); $r=12/N_\star^2 \sim 0.004 < \text{BK18}$ (compatible). [E] registry integrity: the single machine-readable falsifiability surface. Tooling for the closed/open pieces. [E][C] |
| v376_seam_s3_centralcharge.py | S3 closure stack: the central charge $c=8$ extracted NUMERICALLY from the lattice via Calabrese–Cardy finite-size entanglement scaling of the critical free-fermion content (the quantitative core of the MMST scaling-limit claim, on OUR model). [E] one critical complex mode gives $c=1.0000$ (Peschel correlation-matrix EE); [E] the collar is 16 Majoranas = 8 complex modes (v367), $c$ additive $\Rightarrow c=8=g_{\text{car}}+N_{\text{fam}}$ ; [E] chiral $c_-=8$ (Chern $ C =1$ per Majorana v367, non-gappable edge v368). [O] the specific net $(E_8)_1$ is v377/v378; the continuum existence is the cited MMST theorem (v336). Numerical $c=8$ from the lattice; does NOT close SEAM.EQUIV.01. [E][O]                                                                                                                                                                                                                                                                                                          |

| v377_seam_s3_e8character.py | S3 closure stack: the chiral $c=8$ content is the SPECIFIC net $(E_8)_1$ , via the exact affine character $q$ -series + the $\mu_4$ /GSO promotion. [E]<br>$\chi = E_4/\eta^8 = q^{-1/3}(1+248q+4124q^2+\dots)$ : leading $-c/24 = -1/3 \Rightarrow c=8$ ; level-1 $= 248 = \dim E_8$ (one primary). [E] the $\mu_4$ /GSO promotion $SO(16)_1 \rightarrow (E_8)_1$ : $248=240+8$ , $240 = \dim S^+ g_{\text{car}} N_{\text{fam}} = 16 \cdot 5 \cdot 3$ ; $248=120+128 = \dim SO(16) + \text{spinor}$ . [E] discriminator: $(E_8)_1$ has 1 primary/248 currents vs $SO(16)_1$ 4 primaries/120. [O] continuum existence (v336); the $\mu_4$ projection = the seam one-sidedness (S3). Pins the target net; does NOT close SEAM.EQUIV.01. [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v378_seam_s3_modular.py     | S3 closure stack: the GENUS-1 discriminator – torus ground-state degeneracy = 1 (holomorphic = $(E_8)_1$ ), the “hard part” v344 flagged (genus-0 unique vacuum is necessary not sufficient). [E] KLM condensation:<br>$\mu(\text{carrier}) = \det C(D_5) \det C(A_3) = 4 \cdot 4 = 16$ ; the order-4 $\mu_4$ glue ( $ L =4$ )<br>$\Rightarrow \mu(E_8) = 16/16 = 1$ (torus GSD = 1); index-2 $\Rightarrow \mu(SO16) = 16/4 = 4$ . [E]<br>$ \det C(E_8)  = 1$ vs $ \det C(D_8)  = 4$ . [E] the single $(E_8)_1$ character has modular $T$ -eigenvalue $e^{-2\pi i/3}$ ( $h=0, c=8$ ), 1-dim rep $\Rightarrow$ one character $\Rightarrow$ torus GSD = 1. [O] continuum existence (v336). Pins the net at genus-1; does NOT close SEAM.EQUIV.01. [E][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| v379_seam_s3_rp.py          | C7 / OS reconstruction: reflection positivity (the OS axiom) of the explicit gapped collar measure, verified numerically – the remaining constructive-QFT ingredient for the OS reconstruction. [E] the gapped $p+ip$ band gives $G(\tau) = \text{mean}_k e^{-\varepsilon_k \tau}$ with $\varepsilon_k \geq \text{gap}/2 \sim 1 > 0$ (v367) – a positive spectral measure; [E] the Hankel/reflection Gram matrix $M_{ij} = G(\tau_i + \tau_j)$ is PSD – OS reflection positivity holds; [E] neg control: a growing ghost mode makes it indefinite (non-vacuous). [C] RP + gap (v76/v337) + GNS (v240) + $c=8$ (v376) + $(E_8)_1$ (v377/v378) give the OS inputs; C7/QG.AMB.01 is then DISCHARGED by the redundancy theorem v369, not built. [O] the full constructive measure stays the cited step. [E][C][O]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v380_grav_kms_hessian.py    | The KMS Entire Hessian – the Stelle ghost is EXACTLY the Seeley–DeWitt truncation, and resummation pushes it to infinity (upgrades v304/v370 from “assume entire” to a derived statement). [E] the seam KMS cutoff $f(u) = e^{-u}$ (v259) gives the dressed spin-2 propagator $e^{-p^2/M^2}/p^2 = 1/(p^2 a)$ with $a(u) = e^u$ entire & nowhere zero $\Rightarrow$ only the $p^2=0$ pole (no ghost). [E] each finite truncation carries the ghost: the $R+R^2$ order $T_1=1+u$ has the Stelle zero $u=-1$ , the Weyl <sup>2</sup> order $T_2=1+u+u^2/2$ the pair $-1 \pm i$ ; the entire $a$ has none. [E] the ghost DECOUPLES:  nearest zero  of $T_n$ grows monotonically with $n$ (1, 1.41, $\dots$ , 3.07 for $n=1..8$ ) $\rightarrow \infty$ , so “entire” = “do not truncate”. [C] $\Rightarrow$ perturbative graviton unitarity. [O] the exact off-shell curved-space Hessian identification is the cited heat-kernel resummation; perturbative-only, not the non-perturbative measure. [E][C][O]                                                                                                                                                                                                                                                                                                                                                                               |
| v381_qft4d_eg_allorder.py   | The all-order Epstein–Glaser / BRST contract for the perturbative 4D S-matrix $S_{\text{pert}}$ – the “all-order closing statement” for the 4D perturbative QFT leg. Types the standard causal-perturbation-theory closure for the TFPT finite interaction class; it does <i>not</i> build a path integral. [E] POWER-COUNTING: every gauge+matter vertex (Yang–Mills + Dirac–Yukawa + Higgs + ghost) is a mass-dimension-4 marginal operator $\Rightarrow$ the EG singular order $\omega \leq 4 \Rightarrow$ a FINITE counterterm space at every order. [E] BRST NILPOTENCY $s^2=0$ verified via the Jacobi identity for $su(2)$ (residual 0) and $su(3)$ ( $10^{-16}$ ), the carrier weak+colour content. [E] the seam gap $\Delta = 6 \ln(3/2) > 0$ (v302) gives the IR-safe adiabatic limit $g \rightarrow 1$ . [C] imported: $T_n$ exists to all orders by causal factorisation (Epstein–Glaser 1973 / Brunetti–Fredenhagen). [C] imported: all-order BRST invariance (Piguet–Sorella / Kugo–Ojima) $\Rightarrow$ Slavnov–Taylor to all orders. [E] scope fence: matter+gauge ONLY – the $R^2/\text{Weyl}^2$ gravity sub-sector is v304/v370/v380, not a local EG vertex; $S_{\text{pert}}$ is not the ambient measure QG.AMB.01 (v369). NET [C] (imported EG+BRST on the TFPT dim-4 class + gap), prerequisites [E]; extends v269/v271/v273/v278 from 1-loop to all-order [E][C] |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v382_alpha_quillen_exact.py    | Names the Quillen determinant-line VARIATION $\delta_\tau(\log \det_\zeta \Delta_{U(1)} + 8b_1 c_3^6 \log \varphi_{\text{seam}}) = 0$ as a tracked target (review Point 10), elevating EM.WARD.01's residual to a citable [O]. [E] the Quillen split holds at the root $\alpha^3 - 2c_3^3 \alpha^2 = 8b_1 c_3^6 \ln(1/\varphi_{\text{seam}})$ at $\alpha^{-1}=137.0359992$ ( $F_{U(1)}=0$ IS the stationarity of the $U(1)$ determinant line, v341). [E] every coefficient a named atom: $8b_1=\frac{4}{5}\cdot 41$ a $U(1)$ index, $c_3=1/(8\pi)$ Gauss–Bonnet ( $c_3^{3,6}$ heat-kernel powers), $q(D_5)+q(A_3)=2$ discriminant forms (v341/v48/v216). [E] the value $\alpha^{-1}=137.0359992168$ stays closed (unique root + ablation, v3) – only “why this functional” is open. [O] THE TARGET: the from-first-principles AQFT/ $\zeta$ proof that $F_{U(1)}$ is the EXACT Quillen functional. [C] a FACE of SEAM.EQUIV.01 (v336): the seam $U(1)$ determinant line lives on the same holomorphic seam net, so once the net is $(E_8)_1$ its $U(1)$ sub-determinant is fixed – not a second independent gate, it names/tracks the pre-existing EM.WARD.01 residual (v341/v342). No new number (reuses v341, Wolfram-mirrored) [E][C][O]                                                                                                                                                                                                                                         |
| v383_dynamics_universal.py     | DYNAMICS.UNIVERSAL.01: the UNIVERSAL spectral-gap / Perron–Frobenius principle – every TFPT sector is the SAME object (a gapped operator with a UNIQUE leading attractor = the physics, a spectral gap = the reason there is no free parameter), extending v303 from $F_{\text{transfer}}$ to the whole theory. [E] FLAVOR (computed): the cusp transfer spectrum $\{1, (2/3)^6, (1/3)^6\}$ has a simple Perron leading 1 and gap $6 \ln(3/2) > 0$ (v56/v82). [E] DISCRETE COMPILER (computed): the affine- $E_8$ adjacency has Perron eigenvalue 2 (Kac marks, v312/v313) and subleading $2 \cos(\pi/5) = \varphi$ , gap $2 - \varphi = 1/\varphi^2 > 0$ . [E] DECOUPLING MARGIN: $\Delta_{\text{eff}} = 6 \ln(3/2) - 31/(4\pi^2) \approx 1.648 > 0$ (v76/v337). [E] TWO NUMBER-FIELD FACETS (v314): golden $\varphi \in \mathbb{Q}(\sqrt{5})$ (carrier-5, static) and $(2/3)^6 \in \mathbb{Q}$ (family-3, dynamic) are the prime-5 and prime-3 facets of the order-30 Coxeter clock $30 = 2\cdot 3\cdot 5 = h(E_8)$ – a factorisation, not an equality. [C] the other sectors are the same structure: gravity (v358/v359), QG saddle (v365), the holomorphic $c=8$ RG fixed point (v157/v158), the all-order S-matrix (v381), recovery (v221), $F_{\text{transfer}}$ (v303), $\tau=i$ (v333). [C] META-THEOREM: gapped $\Rightarrow$ unique attractor $\Rightarrow$ parameter-free, theory-wide – one spectral-gap statement wearing many hats. A synthesis, no new number [E][C] |
| v384_residual_certification.py | RESIDUAL.CERTIFICATION.01: the residual matrix is CERTIFICATION, not CONSTRUCTION – after v369/v381/v382 there is NO open TFPT physics MECHANISM left; every residual is an external CERTIFICATE of already-determined structure, of three kinds: (A) external math proof, (B) theorem-forbidden, (C) external physics. A ledger-CI audit. [E] LEDGER CI: every residual claim id is present (no orphan). [E] NO-UNIT (B): $c_3=1/(8\pi)$ and $g_{\text{car}}=5$ are mass-dimension 0, so by No-Unit (v153/v364) no dimensionless compiler outputs an absolute scale $\Rightarrow v_{\text{geo}}$ is forbidden by theorem, not a gap. [E] GAP-DECOUPLED (A): $\Delta_{\text{eff}} \approx 1.648 > 0$ (v76/v337) $\Rightarrow$ every readout is independent of the ambient measure (QG.AMB.01 a [C] redundancy, v369). [E] CLASSIFICATION COMPLETE: SEAM.EQUIV.01 (continuum existence = cited MMST/Adamo, v336) $\rightarrow$ A, ALPHA.QUILLEN.EXACT.01 (v382) $\rightarrow$ A, QG.AMB.01 (v369) $\rightarrow$ A, $v_{\text{geo}} \rightarrow$ B, $F_{\text{transfer}}$ (v371–v374, firewall v187) $\rightarrow$ C; ZERO open internal TFPT mechanisms. [C] CONVERGENCE: the only hard things left are theorems and external physics, not missing dynamics. An audit, no new number [E][C]                                                                                                                                                                                          |

| Script                     | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v385_uvbranch_killtest.py  | UVBRANCH.KILLTEST.01: the optional carrier–Pati–Salam UV branch on the ALL-ORDER footing – a single citable kill-test surface with the proton-decay SAFETY hierarchy computed (not a fake $\tau_p$ window). A consolidation (does <i>not</i> re-run the RGE v246 nor re-derive the PS scale v249/v253). [E] carrier content = SM ( $b = (41/10, -19/6, -7)$ , v159/v246, no new states) and $S_{\text{pert}}$ closes to all orders (v381) $\Rightarrow$ the SM-non-unification is all-order-robust. [X] plain-SM 4D-GUT killed ( $\sin^2 \theta_W = 3/8$ vs 0.231; v246). [C] optional carrier-PS branch: $M_{PS} = \kappa M_{\text{scal}}$ , $M_{\text{scal}} = c_3^{7/2} \bar{M}_{\text{Pl}} \approx 3.06 \times 10^{13}$ GeV, $\kappa \in [1.0, 1.2]$ (v253); content $\{1, 10, 16, 45\}$ , no 126 (v247/v248); not the default (v265). [E] proton-decay SAFETY hierarchy: minimal PS gauge bosons are $SU(4)$ leptoquarks ( $B-L$ -conserving $q \leftrightarrow l$ , rare LFV $K_L \rightarrow \mu e$ ), <i>not</i> the $p \rightarrow e^+ \pi^0$ dim-6 operator (needs an $SO(10)/SU(5)$ diquark, absent); the binding bound $M_{PS} \gtrsim 10^6$ GeV is cleared by $M_{PS}/M_{\text{bound}} \sim 10^7 \gg 1$ . [X] frozen kill tests (v265): $\kappa$ leaving $O(1)$ / a forbidden rep / a new gauge-charged state / a rare-LFV signal below the bound; no fake $\tau_p$ . A consolidation, no new number [E][C][X] |
| v386_grav_amplitude.py     | GRAV.AMPLITUDE.01: the entire-form-factor graviton-exchange AMPLITUDE is finite, UV-softened and tree-unitary – perturbative gravity as an explicit scattering problem, extending v304/v370/v380 from the propagator to the amplitude. The dressed spin-2 propagator $P = e^{-p^2/M^2}/p^2 = 1/(p^2 a)$ , $a(u) = e^u$ , $M = M_{\text{scal}}$ . [E] one pole, ghost-free: $a$ entire & nowhere zero (v380) $\Rightarrow$ only pole at $p^2 = 0$ , residue $e^0 = 1 > 0$ . [E] UV-softened: ratio $e^{-u}$ at $u = 1, 5, 10, 20 = 0.37, 6.7 \times 10^{-3}, 4.5 \times 10^{-5}, 2.1 \times 10^{-9}$ (faster than any power). [E] low-energy = GR + a calculable $-p^2/M^2$ correction ( $M = M_{\text{scal}} = c_3^{7/2} \bar{M}_{\text{Pl}}$ , v253). [C] tree unitarity: a single positive-residue pole, no negative-norm states (v370/v380). [C] the amplitude $A = (\kappa^2/2)(T \cdot P_2 \cdot T') e^{-p^2/M^2}/p^2$ is GR at low energy, softened in the UV (perturbative-only; QG.AMB.01 a [C] redundancy v369). No new number [E][C]                                                                                                                                                                                                                                                                                                                                                                              |
| v387_corrections_gap.py    | CORRECTIONS.GAP.01: the practical harvest of v383 – the same spectral gap that makes each sector parameter-free ALSO sets the SIZE of its first correction ( $\text{correction}_n \sim (\lambda_2/\lambda_1)^n$ ). [E] FLAVOR: $\lambda_2 = (2/3)^6 = 64/729 \Rightarrow$ first Koide correction $\sim 0.088$ (v56/v82). [E] RECOVERY: the same $(2/3)^6$ Petz rate (v221). [E] QG: capped by $\chi = 1/(1 - (2/3)^6) = 729/665$ (v337). [E] DISCRETE COMPILER: the update $(A + 2I)/4$ fixes the Kac marks ( $\lambda_1 = 1$ ) and decays at the golden $(\varphi + 2)/4 \approx 0.905$ (carrier-5 facet, v303/v312). [E] the rates split into the $(2/3)^6$ family (family-3, in $\mathbb{Q}$ ) and the golden family (carrier-5, in $\mathbb{Q}(\sqrt{5})$ ) – the two facets of v314/v383. [C] the correction calculus: the gap does double duty (WHY no free parameter AND HOW BIG the first correction), so sub-leading magnitudes are organised, not free. No new number [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v388_corrections_budget.py | CORRECTIONS.BUDGET.01: the gap correction (v387) is a <i>typed</i> budget, NOT a uniform band on every prediction – the $(\lambda_2/\lambda_1)^n$ size is a property of the distance from a gapped operator’s leading eigenvector, so it is only defined where $\lambda_2$ exists. The prediction surface splits into four correction classes (already implied by v303). [E] SEAM-GAPPED: Koide ( $F_{\text{pole}}$ v303), recovery (v221), the QG bound (capped by $\chi = 729/665$ , v337) carry $(2/3)^6$ ; the discrete compiler decays at the golden $(\varphi + 2)/4$ (v312). [E] KOIDE FIRST CORRECTION: $F_{\text{pole}}$ is the ONE seam-gapped prediction, rate $(2/3)^6 \approx 0.0878$ (v371), source quotient 0.33% below $2/3$ – the rate is the suppression SCALE, not the residual. [E] EXACT-IDENTITY class ( $\det R = 8$ , $N_\Phi = 1$ , $\theta_{\text{eff}} = 0$ , $\sin^2 \theta_{13}$ ): no $\lambda_2 \Rightarrow$ correction 0 STRUCTURALLY (a band would contradict [E]). [E] EXTERNAL-RATE class ( $\eta_B/\text{axion}/m_p, m_e$ ): the gapped shape with external rates (only $F_{\text{pole}}$ has the seam rate, v303), firewalled (v187). [E] FIXED-POINT class: the texture is already explicit ( $\theta_{12} \varepsilon = c_3 + 36c_3^4$ ). [C] a uniform band on all predictions is WRONG; the size is keyed to the mechanism class. A typing of v387, no new number [E][C]           |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v389_grav_loop_finiteness.py   | GRAV.LOOP.FINITE.01: the entire-form-factor graviton is UV-finite at the <i>loop</i> level by power counting – the honest next step past v386 (tree), extending v304/v370/v380/v386 from the propagator to the superficial degree of divergence. Honest scope: the standard infinite-derivative/nonlocal-gravity finiteness statement, NOT a full proof of perturbative QG. [E] super-polynomial falloff $p^k e^{-p^2/M^2} \rightarrow 0$ for every $k$ . [E] one dressed line turns a quadratic divergence into the finite $(M^2/2)e^{-p_0^2/M^2}$ ; the GR $\int p^3/p^2 dp$ diverges quadratically. [E] the superficial degree $\rightarrow -\infty$ at every loop order (dressed cutoff-ratio $\rightarrow 1$ vs GR $\rightarrow 4$ ). [E] the regulator is the SEAM scale $M = M_{\text{scal}} = c_3^{7/2} \bar{M}_{\text{Pl}}$ (v253/v259), not a dial. [C] loop UNITARITY of the nonlocal form factor (Lorentzian continuation / macro-causality) stays the honest open point – tree unitarity is v386; NOT claimed solved. No new number [E][C][O]                                                                                                                                                 |
| v390_prime2_facet.py           | COXETER.PRIME2.01: the prime-2 facet of the order-30 Coxeter clock, completing v383. The clock $30 = 2 \cdot 3 \cdot 5 = h(E_8)$ had two named facets (golden $\varphi \in \mathbb{Q}(\sqrt{5})$ , prime-5/carrier; $(2/3)^6 \in \mathbb{Q}$ , prime-3/family); this names the prime-2 facet as the Gaussian field $\mathbb{Q}(i) - \tau = i$ and the order-4 $\mu_4 = \mathbb{Z}/4$ square seam deck (v282/v288/v333), structure already present. [E] $h(E_8) = 30$ factors into exactly three primes. [E] one quadratic facet field per prime, each ramified at its prime: disc $\mathbb{Q}(i) = -4$ , disc $\mathbb{Q}(\sqrt{-3}) = -3$ , disc $\mathbb{Q}(\sqrt{5}) = 5$ ; ramified primes $\{2, 3, 5\}$ , product = 30. [E] prime-2 Gaussian facet: min. poly $x^2 + 1$ , $\tau = i$ , $j(i) = 1728 = 12^3$ , $ \mu_4  = 4 = 2^2$ (the static seam-orientation facet). [E] prime-5 golden (v383): $2 \cos(\pi/5) = \varphi$ (pentagon). [E] prime-3 family (v383/v220): $(2/3)^6$ plus the Eisenstein $\zeta_3$ (hexagonal CP $\pi/3$ ). [C] completion: each prime carries a facet (square/hexagon/pentagon = seam/CP/carrier), the prime set forced by $h(E_8)$ . A synthesis, no new number [E][C] |
| v391_alpha_quillen_progress.py | ALPHA.QUILLEN.PROGRESS.01: an <i>honest attempt</i> at the external target ALPHA.QUILLEN.EXACT.01 (v382) – it REDUCES the open step to a sharper named sub-target via a solvable model but does NOT close it; ALPHA.QUILLEN.EXACT.01 stays [O] (external math, type A, v384). [E] solvable model $\det_\zeta(-\partial_\tau^2 + m^2)$ on a circle $= (2 \sinh(\beta m/2))^2$ , $m$ -variation $\beta \coth(\beta m/2) = 2/m + (\beta^2/6)m - (\beta^4/360)m^3 + \dots$ a closed heat-kernel/Laurent series ( $m^3$ coeff $-1/360$ verified). [E] a $\zeta$ -det variation is structured heat-kernel data, so v382's $8b_1c_3^6$ counterterm (a Gauss–Bonnet heat-kernel power) is the right <i>kind</i> of object. [E] the v382 split re-verified at $\alpha^{-1} = 137.0359992$ . [E] reduction: the open step reduces to the named sub-target “seam Seeley–DeWitt coefficient $= 8b_1c_3^6$ ”. [O] NOT CLOSED: the actual seam $\zeta$ -det proof stays open, SEAM.EQUIV.01 continuum existence (v336) the other external [O]; $\alpha^{-1}$ stays [E]. An attempt that reduces, does not close [E][O]                                                                                                   |
| v392_seam_s3_scalinglimit.py   | SEAM.S3.SCALINGLIMIT.01: an <i>honest attack</i> on the one open lemma of SEAM.EQUIV.01 (the continuum scaling-limit existence, v336) – it does NOT close it (the abstract existence is the cited MMST theorem); it STRENGTHENS the case with the existence-relevant observable v376 did not test: that the finite-size data <i>converge</i> . [E] the Calabrese–Cardy EE slope $c_1(L)$ at $L = 66 \dots 514$ is a monotone Cauchy-like sequence approaching 1 ( $ c_1(L) - 1 $ strictly decreasing). [E] a $1/L$ Richardson fit gives $c_1(\infty) \approx 1.000$ , so the 16-Majorana collar $c = 8c_1 \approx 8.00 = g_{\text{car}} + N_{\text{fam}}$ is reached <i>in</i> the limit. [E] the successive differences are strictly decreasing (numerical Cauchy, necessary for existence). [O] convergent data are evidence, not a proof of existence (MMST v336), and do not pin $(E_8)_1$ vs $SO(16)_1$ (holomorphy v377/v378). Strengthens the residual, does NOT close it [E][O]                                                                                                                                                                                                                    |

*continued on next page*

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v393_corrections_numeric.py  | CORRECTIONS.NUMERIC.01: the typed correction budget (v388) turned into ACTUAL first-correction magnitudes – a computed theoretical-uncertainty surface, the short-term testable harvest of v388. [E] FIXED-POINT band $(\theta_{12}/\theta_{13}/\lambda_C/\beta_{\text{rad}}) =$ the explicit $\varphi_0$ puncture term $36c_3^4/c_3 = 9/(128\pi^3) \approx 0.227\%$ (exact; $= \theta_{12}$ 's $\varepsilon$ first-correction). [E] SEAM-GAPPED band (Koide/recovery) $= (2/3)^6 \approx 8.78\%$ ; the QG bound capped by $\chi - 1 = 64/665 \approx 9.62\%$ (v337). [E] EXACT-IDENTITY band = 0 structurally ( $\det R = 8$ , $N_\Phi = 1$ , $\theta_{\text{eff}} = 0$ ). [E] EXTERNAL-RATE band = external physics quoted ( $m_p/m_e \pm 7.5\%$ v374; $n_s/r N_\star$ band; $\eta_B 1.07 \times \text{v212}$ ), fenced v187. [C] each prediction gets “central value $\pm$ computed first correction”. A harvest of v388, no new number [E][C]                                                                                        |
| v394_coxeter_atoms.py        | COXETER.ATOMS.01: the clockwork coherence – the three Coxeter primes ARE the three anchor atoms ARE the three number-field facets, and the prime-2 seam is the common dynamical factor. A bird's-eye [E] re-reading tying v390 (facets) to the anchor $a = (1, 1, 2)$ and v319 (5x6 clock); registers RES.COXETER.SYMMETRY.01 as a tracked [O]. [E] $a = (1, 1, 2)$ : $e_3=2= Z_2 $ , $p_0=3=N_{\text{fam}}$ , $e_2=5=g_{\text{car}}$ , product $30=h(E_8)$ . [E] atoms = facet fields (v390): $2 \rightarrow \mathbb{Q}(i)$ , $3 \rightarrow \mathbb{Q}(\sqrt{-3})$ , $5 \rightarrow \mathbb{Q}(\sqrt{5})$ , each ramified at its prime. [E] $\chi=729/665=3^6/(3^6-2^6)$ , $(2/3)^6=2^6/3^6$ , exponent $6=2N_{\text{fam}}$ . [E] both dynamic rates carry prime-2: $2/3= Z_2 /N_{\text{fam}}$ , $(\varphi+2)/4=(\varphi+2)/ \mu_4 $ , $ \mu_4 =4=2^2$ . [E] $30=5 \times 6=g_{\text{car}}(2N_{\text{fam}})$ . [C] the seam is the universal dynamic engine. [O] RES.COXETER.SYMMETRY.01 registered, not closed [E][C][O]              |
| v395_hypergraph_coupled.py   | HYP.COUPLED.01: the coupled hypergraph rewrite – one local rule unifies v299/v327/v324 (carrier $\times$ family). [E] LOCAL COUPLED MICRO-RULE: state on 9 affine- $E_8$ nodes $\times$ 3 family slots; one micro-step = network lazy diffusion on each cusp column + v327 $M$ on each node's family vector; steps commute, $T_{\text{micro}} = T_{\text{net}} \otimes M$ . [E] JOINT ATTRACTOR: top eigenvalue 1 with eigenvector $\text{marks} \otimes e_0$ ; iteration from any positive start converges. [E] ONE HAND = RECOVERY: one network step + $2N_{\text{fam}}$ family micro-steps gives $(2/3)^6$ on $\text{marks} \otimes v_{\text{surv}}$ . [E] v324 EMERGES: $T_{\text{full}} = T_{\text{net}} \otimes T_{\text{cusp}}$ shares the same invariants; $T_{\text{cusp}}$ is the 6-hand readout in the Galois/cusp basis (v317). [E] GROWTH + FIBER: v299 $E_6 \rightarrow E_7 \rightarrow E_8 \rightarrow \hat{E}_8$ unchanged with $M$ -fiber attached. [O] 3-arm seed $(P_2) + \varphi_0$ (v312) remain irreducible [E][O] |
| v396_phi0_icosahedral.py     | HYP.PHI0.01: the $\varphi_0$ leading term from icosahedral combinatorics (sharpening v312/v395). [E] ICO COUNTS ANCHOR-FORCED: $V=12$ , $E=30=h(E_8)$ , $F=20=g_{\text{car}}(g_{\text{car}}-1)$ , $ \text{Aut} =120=4h= 2I $ . [E] LEADING TERM EXACT: $\varphi_0^{\text{ree}}=1/(6\pi)=(4/3)c_3=F/(4h\pi)=F/( \text{Aut} \pi)=(F/(g_{\text{car}}N_{\text{fam}}))c_3$ . [E] $F/h= Z_2 /N_{\text{fam}}$ ; leading term $=(F/h)/(4\pi)=c_3(g_{\text{car}}-1)/N_{\text{fam}}$ . [E] GAUSS-BONNET: icosahedron deficit sum $4\pi$ ; $c_3=1/( Z_2 4\pi)$ (v216/v342). [E] HONEST NEGATIVE: puncture $48c_3^4$ not a rational hypergraph fraction. [C] tree-level seed = (hyperedges)/( $g_{\text{car}}N_{\text{fam}}$ ) $\times c_3$ , not an independent injection; puncture [O]                                                                                                                                                                                                                                                             |
| v397_external_clock_probe.py | FR.CLOCK.PROBE.01: a <i>falsifiable</i> probe of how external the “external physics” really is – do the frontier scheme-numbers land on the $\{2, 3, 5\}$ clock (the anchor atoms, v394) or not? Strict No-Free-Pattern (v100): “on the clock” = an EXACT match, not a wide-band fit. [E] $\eta_B$ decuple $A_\Lambda=10= Z_2 g_{\text{car}}$ ON CLOCK (v212). [E] Koide rate $(2/3)^6=( Z_2 /N_{\text{fam}})^6$ ON CLOCK (v303). [E] axion spine angle $3\pi/5=\pi N_{\text{fam}}/g_{\text{car}}$ ON CLOCK (v211). [E] proton $C_p \sim 2.83 \pm 0.15$ NOT discriminating ( $2^{3/2}$ , $17/6$ , $14/5$ all fit the band) $\Rightarrow$ EXTERNAL (firewall v187/v374). [C] 3 of 4 land exactly on the clock; the irreducible external residue shrinks to the proton QCD number $C_p$ – “external physics” was overstated. [E] anti-numerology: refuses to assign $C_p$ a clock value [E][C]                                                                                                                                             |

*continued on next page*

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v398_seam_state_rigidity.py  | <b>Seam State Rigidity Theorem</b> (Paper A, the $G_{\text{net}}$ closure contract): the scattered state-invariance reductions (v177/v198/v199/v308/v309/v335) as ONE named target. [E] RP-definability hinge (OS canonical transfer $T=e^{-H}$ from RP + reflection alone, v54, on a quasi-free state v155, no $\mu_4$ normal form); [E] band-limited core $[\rho,  k ]=0$ and character-block-diagonal sub-principal symbol swept $N=4.64$ (beyond the 3-dim $H^1$ ); [E] holomorphy $\Rightarrow (E_8)_1$ ( $c=8$ , $ \det \text{Cartan} =1$ vs 4, index $4= \mu_4 $ , gap $6 \log \frac{3}{2} > 0$ ). [O] the one residual: $[\rho, \Lambda_\Sigma]=0$ on the full $L^2$ (intrinsic Bisognano–Wichmann). A contract+evidence module, NOT a closure of SEAM.EQUIV.01 (continuum = cited MMST v336)                                                                                                                                                   |
| v399_gravity_complete.py     | <b>Gravity-complete = Boundary-complete + Ambient-redundancy</b> (Paper B accounting): combines the parameter-free local equation (v358/v359) and the ambient redundancy (v369). [E] $G_{ab} + \Lambda g_{ab} = (1/c_3)T_{ab}$ , $1/c_3=8\pi$ (four $c_3$ -roles), $\Lambda$ prefactor $3/(4\pi^2)$ ; [E] redundancy discriminators ( $ \det \text{Cartan} =1$ vs 4, torus GSD=1, Petz $(2/3)^6$ , margin $1.648 > 0$ ); [E] $\mathcal{O}_{\text{phys}} \subset \mathcal{A}_\Sigma$ over five readout classes (Newton $8\pi$ , $\Lambda$ , scalaron $c_3^7$ , horizon $1/ \mu_4 $ , recovery $(2/3)^6$ ) – all boundary/seam/gap. [C] the verdict; [O] SEAM.EQUIV.01 + intrinsic BW (no new gate)                                                                                                                                                                                                                                                       |
| v400_grav_nonlocal_action.py | <b>Nonlocal spectral-gravity action</b> with the local $R+R^2$ as its IR projection (Paper C, consolidating v304/v370/v380/v386). [E] the entire form factor $a=e^u$ gives the dressed propagator $1/(p^2 a)$ ONE pole (residue 1, ghost-free); [E] every truncation carries a Stelle zero whose nearest-zero modulus grows monotonically (v380); [E] the IR order $a=1+u+u^2/2+\dots$ reproduces the spectral-action $R+R^2$ (v28/v36) with the atom-fixed scale $M_{\text{scal}}^2/\bar{M}_{\text{Pl}}^2=c_3^7$ ( $7=g_{\text{car}}+N_{\text{fam}}-1$ , v253). [O] the entire- $a$ analyticity assumption + perturbative-only (not the ambient measure QG.AMB.01, a [C] redundancy v369)                                                                                                                                                                                                                                                              |
| v401_metrology_closure.py    | <b>Metrology closure</b> of the final input set $\{a, \pi, v_{\text{geo}}\}$ (Paper D, consolidating v153/v274/v364/v384). | v404_e8_char_cm_duality.py | E8.CMDUAL.01: the $(E_8)_1$ vacuum character $\chi_{E_8}=E_4/\eta^8=j^{1/3}$ at the two CM points – 12 at the seam ( $\tau=i$ ), 0 at the family ( $\tau=\omega$ ), extending v282. [E] $\chi_{E_8}^3=j$ (q-series). [E] SEAM $\tau=i$ ( $\mathbb{Q}(i)$ , order 4): cross-ratio $2 \Rightarrow j=1728 \Rightarrow \chi_{E_8}(i)=1728^{1/3}=12$ ( $E_8$ present, v214/v282). [E] FAMILY $\tau=\omega$ ( $\mathbb{Q}(\sqrt{-3})$ , order 6): the equianharmonic $\lambda$ ( $\lambda^2-\lambda+1=0$ ) $\Rightarrow j=0 \Rightarrow \chi_{E_8}(\omega)=0$ ( $E_4$ vanishes, v220/v267). [E] $\tau=i, \tau=\omega$ are the ONLY elliptic points of $\text{PSL}(2, \mathbb{Z})$ , so the values are forced. [C] the seam/flavor rigidity duality: the seam is rigid where $E_8$ is present ( $\chi=12$ , SEAM.EQUIV.01 closes), the flavor/CP sector is the soft residual where $E_8$ degenerates ( $\chi=0$ ); the dual-keystone candidate (flavor = the $j=0$ degeneration of $(E_8)_1$ ) [E][C]                                                                                                                                                                                                                                          |
| v405_seam_equiv_omega.py   | SEAM.EQUIV.02 – the dual keystone at $\tau=\omega$ : the family/flavor sector as the order-3 Eisenstein/ $A_2$ face of $E_8$ , dual to the seam = $(E_8)_1$ at $\tau=i$ (v404). A named contract (genre of v286/v398), NOT a closure. [E] $\chi_{E_8}(\omega)=0$ ( $E_8$ degenerates at the family CM point) vs $\chi_{E_8}(i)=12$ . [E] $A_2$ is the $\tau=\omega$ Eisenstein lattice (Cartan $\det=3=N_{\text{fam}}$ , $h=3=N_{\text{fam}}$ , $\mu_6=\mu_3 \times \mu_2$ ). [E] $R$ lives in $E_6 \times A_2$ : $248=\ R\ _F^2 + \det R + 2(1^\top R a)N_{\text{fam}}=78+8+2 \cdot 27 \cdot 3$ , $\ R\ _F^2=78=\dim E_6$ , $\det R=8=\dim A_2=\text{rank } E_8$ . [E] $\delta_{\text{PMNS}}=4\pi/3$ is the $\tau=\omega$ hexagonal CM phase ( $\arg \zeta_6=\pi/3$ , v220/v233). [E] the cusp weights $\{0, 1/3, 2/3\}$ are the order-3 deck = $N_{\text{fam}} = \det Q$ (v72), $\text{Spec}(Q_+)=(1, 2, 3)$ (v69/v137). [C] the family/flavor sector is the order-3 Eisenstein/ $A_2$ deck at $\tau=\omega$ ; the two keystones sit at the only two elliptic points of $\text{PSL}(2, \mathbb{Z})$ . [O] residual = the canonical $\mathbb{Z}_3$ deck map (v140) + the $v_{\text{geo}}$ -class scale (No-Unit v153) [E][C][O]        |
| v406_pmns_phase_origin.py  | FLAV.PMNS.CLOSE.01: the PMNS dynamics closed modulo the $\tau=\omega$ keystone (v405) – the CP-phase ORIGIN is the family CM point and the absolute scale is one $v_{\text{geo}}$ -class unit, so PMNS has zero free flavor dials beyond $v_{\text{geo}}$ . [E] the three angles ( $\sin^2 \theta_{12}=\frac{1}{3}-\frac{\varphi_0^{\text{ret}}}{2}$ , $\theta_{23}=45^\circ$ , $\sin^2 \theta_{13}=\varphi_0^{\text{ret}} e^{-5/6}$ ; v9/v268) assemble to one unitary $U_{\text{PMNS}}$ (v270). [C] CP-PHASE ORIGIN (advance over v270): $\delta_{\text{PMNS}}=4\pi/3$ is the $\tau=\omega$ hexagonal CM phase (v405/v220/v233), upgrading v270's [O] assembled input to a keystone consequence. [C] $J_{\text{PMNS}}=-0.0297$ derived. [E] the absolute scale = one seesaw ratio $m_3=(y_\nu v_{\text{EW}})^2/M_R$ = a $v_{\text{geo}}$ -class UV input (v272/v153), NOT a flavor gap. [C] net: PMNS = angles + $\delta$ [keystone] + $J$ [derived] + scale [ $v_{\text{geo}}$ ], zero free flavor dials. [O] residual = the seesaw operator realisation ( $M_R$ not a clean $\bar{M}_{\text{Pl}}$ power, v272/v184; one-parameter carrier-normalised candidate v481) + the normal-ordering $\Sigma m_\nu$ floor kill test [E][C][O] |
| v407_dn_pairings_omega.py  | FLAV.SELECTOR.CLOSE.01: the $R4'$ residue folds into the $\tau=\omega$ keystone (v405) – the three $(d, n)$ selector pairings ARE the $\tau=\omega$ family-slice atoms. [E] the frame $(\mathbf{1}, a, \sigma)$ is a $\mathbb{Z}^3$ basis with $\det=11=\ Pl(K)\ _1$ , and $n=(5, -9, 6)$ is the unique covector with $n \cdot \mathbf{1}=2$ , $n \cdot a=8$ , $n \cdot \sigma=121=11^2 \Rightarrow (d, n) \Rightarrow R$ columnwise (v136/v139). [E] $n \cdot a=8=\text{rank } E_8=\dim A_2=\det R$ – the anchor-pairing is the $A_2$ ( $\tau=\omega$ ) block dimension that reads $R$ in $E_6 \times A_2$ (v405). [E] the pairings $\{2, 8, 121\}=\{ Z_2 , \text{rank } E_8=\dim A_2=\det R, \ Pl(K)\ _1^2\}$ are the $\tau=\omega$ family-slice atoms (the $\mu_2$ sheet, the $A_2$ block, the Plucker frame). [E] the square selects the point ( $\sigma$ -pairing $11(11+t)$ , a perfect square only at $t=0$ ). [C] deriving $(d, n)$ ( $R4'$ ) folds into SEAM.EQUIV.02 – $d=\frac{3}{2}a-21$ anchor-derived (v139), the pairings the slice atoms. [O] the lone flagged residue “why $11=\ Pl(K)\ _1$ ” [E][C][O]                                                                                                                |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v419_seam_galois_carrier.py   | <p>The seam <math>\mu_4</math> is the carrier's Galois group: a positive resolution of the <b>v409/RES.COXETER.SYMMETRY.01</b> cyclic/Galois asymmetry. [E] <math>h(E_8)=30=2\cdot3\cdot5</math> is squarefree, so <math>\mathbb{Z}/30</math> has <i>no</i> order-4 element — the seam <math>\mu_4</math> cannot be a cyclic hand and is forced onto the Galois side; [E]</p> <p><math>(\mathbb{Z}/30)^\times = (\mathbb{Z}/2)^\times \times (\mathbb{Z}/3)^\times \times (\mathbb{Z}/5)^\times = \mu_4 \times \mathbb{Z}_2</math> (order <math>\varphi(30)=8=\text{rank } E_8</math>), where the <math>\mu_4</math> <math>(\mathbb{Z}/4)</math> factor IS <math>(\mathbb{Z}/5)^\times</math> (carrier 5) and the <math>\mathbb{Z}_2</math> IS <math>(\mathbb{Z}/3)^\times</math> (family/CP); [E] so the seam <math>\mu_4 = \text{Gal}(\mathbb{Q}(\zeta_5)) = (\mathbb{Z}/5)^\times</math>, the Frobenius <math>\zeta_5 \mapsto \zeta_5^2</math>, realised on the carrier clock <math>C_5</math> (<b>v418</b>) by the explicit order-4 operator <math>G</math> with <math>GC_5G^{-1}=C_5^2</math>, <math>G^4=I</math>, <math>G^2C_5G^{-2}=C_5^{-1}</math>. [C] resolves <b>v409</b> (the <math>2^2=4</math> is the order of <math>(\mathbb{Z}/5)^\times</math>; “no contraction rate” because the seam is an automorphism, not a hand); <math>\mathbb{Q}(\zeta_{30})</math> carries both <math>E_8</math> invariants (cyclic <math>h=30</math>, Galois rank=8). Figure <b>coxeter_galois</b> [E][C]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| v420_fpole_qed_running.py     | <p>F_pole external: the Koide source→pole transfer is a <i>one-loop electromagnetic</i> effect, not an algebraic step — the honest external-physics follow-up to <b>v93</b> and the clock No-Go. [E] Koide <math>Q</math> is rescaling-invariant (<math>Q(cm)=Q(m)</math>), so flavor-<i>universal</i> running leaves it fixed and the source→pole shift is purely flavor-<i>split</i>; [C] the tree→pole gap <math>\frac{2}{3}-Q_{\text{src}}=0.00220</math> is one-loop-EM-sized (<math>=\varphi_0^{\text{ret}}/24</math> to 0.6%, <math>=\alpha/\pi</math> to <math>\sim 5\%</math>), the PDG pole sits AT <math>\frac{2}{3}</math> (the IR attractor); [C] a 1-loop QED per-lepton-log pole <math>\leftrightarrow \overline{\text{MS}}</math> estimate shifts Koide by EM-loop order toward <math>\frac{2}{3}</math> (the <b>v82</b> IR-attractor direction); [O] the EXACT flow time <math>t\sim 2.84</math> (<b>v93</b>) is scheme/scale-dependent external QED, only sized. [C] F_pole stays [C], firewalled (<b>v187</b>): the lens forces the RATE <math>(2/3)^6</math>, this external EM supplies the flow. Numerical (mpmath), Python-only [E][C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| v422_galois_net_bridge.py     | <p>The Galois<math>\leftrightarrow</math>Net bridge: the seam <math>\mu_4 = \text{Gal}(\mathbb{Q}(\zeta_5))</math> is the SAME cyclic <math>\mathbb{Z}/4</math> as the <math>(E_8)_1</math> simple-current glue — not a mere order-4 coincidence — linking the Galois gearbox of <b>v419</b> to <b>G<sub>net</sub>/SEAM.EQUIV.01</b>. [E] <math>\text{disc}(A_3)=\text{disc}(D_5)=\mathbb{Z}/4</math> (one Smith invariant factor 4 = cyclic, <math>\det=4</math>); <math>D_n</math> disc is <math>\mathbb{Z}/4</math> for <math>n</math> ODD, <math>\mathbb{Z}_2 \times \mathbb{Z}_2</math> for <math>n</math> EVEN, so the carrier <math>D_5</math> (rank <math>5=g_{\text{car}}</math>, odd) is cyclic while the control <math>D_8</math> (rank 8, even) is Klein; [E] <math>\text{Gal}(\mathbb{Q}(\zeta_5))=(\mathbb{Z}/5)^\times=\langle 2 \rangle</math> is cyclic order 4 (only the carrier prime 5 gives order 4); [E] in <math>\text{disc}(D_5 \oplus A_3)=\mathbb{Z}_4 \times \mathbb{Z}_4</math> (<math>16=\dim S^+</math>) the simple current <math>(1,1)</math> is order 4 (cyclic) with Lagrangian quotient <math>16/4^2=1 \Rightarrow (E_8)_1</math> (holomorphic, <b>v89/v154</b>). [E] NEG control: the Klein <math>\mathbb{Z}_2 \times \mathbb{Z}_2</math> / order-2 halfway <math>\langle (2,2) \rangle</math> gives <math>16/2^2=4= \text{disc}(D_8) =SO(16)</math> (<math>\det=4</math>), NOT <math>E_8</math> (<math>\det=1</math>) — cyclic <math>\mathbb{Z}/4 \rightarrow E_8</math>, Klein <math>\rightarrow D_8</math>. [C] the bridge: one cyclic <math>\mathbb{Z}/4</math> threads the seam deck <math>\mu_4</math> (<b>v419</b>), <math>\text{Gal}(\mathbb{Q}(\zeta_5))</math> and the <math>(E_8)_1</math> glue (<b>v1/v89/v154</b>); cyclicity forced by 5, Klein excluded. [C] this is the four-fold <math>\mu_4</math> identity (deck/divisor = Galois = discriminant = simple-current); per <b>v428</b> a <i>compression</i> (one object read four ways), not four independent witnesses [E][C]</p> |
| v423_no_ambient_dependency.py | <p>The <i>No-Ambient-Dependency</i> certificate: no frozen TFPT readout is <i>computed</i> from the ambient QG measure <b>QG.AMB.01</b> — sharpening the <b>v369/v384</b> prose redundancy into a machine-checked DAG+script fact, told honestly. [E] gap-decoupling margin <math>\Delta_{\text{eff}} = 6 \ln(3/2) - 31/(4\pi^2) \approx 1.648 &gt; 0</math> (<math>31=2^{g_{\text{car}}}-1</math>), susceptibility <math>\chi = 729/665</math> finite (neg control gap <math>\rightarrow 0 \Rightarrow \chi \rightarrow \infty</math>). [E] <b>QG.AMB.01</b> is a certification <i>sink</i>: every claim listing it as a dependency is a gravity-gate/QG row, none a frozen prediction. [E] it is not a value source — it has no producing script while each frozen readout is computed by a compiler script (<math>\alpha^{-1} \leftarrow \mathbf{v3}</math>, <math>\theta_{12} \leftarrow \mathbf{v9}</math>, <math>\theta_{13} \leftarrow \mathbf{v268}</math>, cosmology <math>\leftarrow \mathbf{v7}</math>). [E] the one transitive link is architectural: only <math>\theta_{13}</math> references <b>QG.AMB.01</b>, via the 4D-QFT contract spine (<b>PS.DIRAC</b>→<b>CONTRACT.QFT4D</b>→<b>QG.G2</b>→<b>GATE.METRIC</b>), a coherence edge not a numerical input; <math>\alpha^{-1}/\theta_{12}</math>/cosmology have no route. [C] so <b>QG.AMB.01</b> is gap-decoupled certification (<b>v369</b> as a DAG/script fact); honestly this does NOT prove <b>SEAM.EQUIV.01</b> — the readouts depend on the seam being <math>(E_8)_1</math>; <b>QG.AMB.01</b> specifically is dead [E][C]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v424_seam_lto_rp_reduction.py  | The ( <i>LTO-RP</i> ) reduction of the keystone: an honest MMST-style reduction of SEAM.EQUIV.01's one open lemma — the raw collar's intrinsic Bisognano–Wichmann property (the v308/v309 residual) — to the cited commuting-projector theorem of Naaijken–Penneys–Wallick (arXiv:2605.10693), with the central mapping <i>corrected</i> . [E] the $\mu_4$ clock is a modular <i>symmetry</i> ( $[\rho, K]=0$ , v309/v199), not the flow — $\sigma^\psi=\rho$ is type-wrong (a one-parameter group versus a finite order-4 element). [E] NPW26's axiom (LTO-RP) means $u_\Theta=J$ (reflection = modular conjugation) = the intrinsic BW condition $\theta K \theta = -K$ , <i>distinct</i> from $\omega \circ \rho = \omega$ : a positive character-block-diagonal $K$ satisfies $[\rho, K]=0$ yet never $\theta K \theta = -K$ , so clock-invariance does <i>not</i> imply (LTO-RP). [O] make-or-break: NPW26 prove (LTO-RP) for <i>topologically ordered</i> models (Toric Code $ \det K =4$ via a trace; Levin–Wen anyonic), while the seam is invertible ( $ \det \text{Cartan}(E_8) =1$ , no anyons) and a $\beta=1$ KMS state (not a trace) — in neither proved bucket (neg control $D_8$ $ \det =4$ ). [C] so SEAM.EQUIV.01's BW residual reduces to NPW26 Theorem A modulo two open sub-steps (realise the seam as a $\mathbb{Z}_2$ -reflection commuting-projector LTO; extend (LTO-RP) to the invertible KMS case) — a reduction, not a closure; SEAM.EQUIV.01 stays [O] [E][C] |
| v425_dyn_transfer_universal.py | DYN.TRANSFER.UNIVERSAL.01 — the <i>single-flow reduction</i> of $F_{\text{transfer}}$ : the four frontier transfers ( $F_{\text{pole}}$ , $F_{\text{Boltzmann}}$ , $F_{\text{relic}}$ , $F_{\text{QCD}}$ ) do not each need a separate external solver; their <i>dynamics</i> is the ONE native flow of the theory — the seam modular/recovery semigroup (v238/v240, gap $6 \ln(3/2)$ ) restricted to each sector. [E] recovery spectrum $\{1, (2/3)^6, (1/3)^6\}$ , $H_{OS} = -\log T$ gap $6 \ln(3/2)$ , $e^{-\Delta} = (2/3)^6$ exact; an explicit column-stochastic $T$ makes $\log T$ a Markov generator. [E] $F_{\text{pole}}$ is this flow: the v99 generator $\dot{q} = (\Delta/N_{\text{fam}})(q-2)(q-5)$ linearised at $q=2$ has rate $-\Delta$ , time-1 contraction $(2/3)^6$ . [E] $F_{\text{Boltzmann}}$ washout = that contraction, CP phase $4\pi/3$ native (v320). [E] $F_{\text{QCD}}$ rate native ( $b_3=-7$ ). [C] only the anchors ( $v_{\text{geo}}$ , $C_p$ , $M_R$ ) external; $F_{\text{relic}}$ 's cosmological IC $\theta_i$ the one wall. Extends v383 static→dynamic; a reduction, no new premise [E][C]                                                                                                                                                                                                                                                                                                                                                       |
| v426_seam_lto_rp_kms.py        | SEAM.EQUIV.LTORP.KMS.01 — the <i>invertible</i> $\beta=1$ -KMS variant of (LTO-RP), the corner NPW26 leave open (they prove it for topologically-ordered models; the seam is invertible + $\beta=1$ KMS, not a trace). A constructive Tomita–Takesaki witness advancing v424 sub-step (ii); does <i>not</i> close SEAM.EQUIV.01. [E] build $K$ reflection-odd/ $\mu_4$ -even/gapped (gap $2k=6 \ln(3/2)$ ); $C=1/(1+e^K)$ the $\beta=1$ KMS covariance, $C/(1-C)=e^{-K}$ (genuine KMS, not trace). [E] $\Theta K \Theta^{-1} = -K$ ( $u_\Theta=J$ ) AND $[\rho, K]=0$ both hold $\Rightarrow$ (LTO-RP) satisfied by direct Tomita–Takesaki. [E] $ \det \text{Cartan}(E_8) =1$ (invertible, no anyons) vs anyonic $ \det =4$ ; state not a trace ( $\Delta=e^{-K} \neq I$ ) — neither NPW26 bucket. [E] neg controls: side-even reflection $\rightarrow +K$ (BW fails), off- $\mu_4$ -block $K$ breaks $[\rho, K]$ . [C] (LTO-RP) reduces to $(\Theta K \Theta = -K) \wedge ([\rho, K]=0)$ , constructively satisfiable; SEAM.EQUIV.01 stays [O] [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| v427_overdet_witness_map.py    | OVERDET.WITNESS.MAP.01 — the multiply-vs-compress <i>framework</i> for over-determination: witnesses from <i>disjoint</i> grammars multiply, projections of the <i>same</i> generator compress. The classification of the seven arithmetic witnesses is refined by v428 (they compress). [E] seven grammar readouts, each from its own syntax landing on the carrier skeleton: Gauss $N(3+2i)=13$ , Eisenstein $N(3+2\omega)=7$ , cyclotomy $N(3+2\zeta_5)=55$ , Galois $ (\mathbb{Z}/5)^\times =4$ , $ \det \text{Cartan}(E_8) =1$ , Pascal $\binom{4}{0} + \binom{4}{1} + \binom{4}{2} = 11$ ( $2^4=16 = \dim S^+$ ), Coxeter $h(E_8)=30=2 \cdot 3 \cdot 5$ with $\varphi(30)=8 = \text{rank } E_8$ . [E] by v236 these are facets of ONE $(2, 3, 5)/E_8$ object, so syntactic distinctness is NOT independence — they compress, like the anchor $a=(1, 1, 2)$ . [C] the genuine multiplicative strength is the multiply-forced inputs + foreign witnesses (v428); the map does not by itself establish physics [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v428_overdet_reclass.py          | OVERDET.WITNESS.RECLASS.01 — the honest correction of v427: applying its own multiply-vs-compress test to itself. [E] the $(2, 3, 5)$ Brieskorn singularity (v236) is the ONE generator — Milnor $\mu=(2-1)(3-1)(5-1)=8=\text{rank } E_8$ , $30=2\cdot 3\cdot 5=h(E_8)$ , $\varphi(30)=8$ . [E] every one of v427's seven witnesses maps to a facet of that SAME object (primes 2, 3, 5 of 30, the clock 30, or $E_8$ ), so all seven collapse to ONE generator (distinct objects = 1) $\Rightarrow$ COMPRESSION, not seven multiplications. [E] what honestly multiplies is the input forced four independent ways — the “8” in $c_3=1/(8\pi)$ from rank $E_8$ , $h(D_5)=2(5-1)$ , $\varphi(30)$ and the Milnor number — plus the foreign witness $\alpha^{-1}\approx 137$ (prime, not in the $(2, 3, 5)$ -skeleton). [C] refines and partly walks back v427; consistent with v236/v305/v313 [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| v429_axion_pentagon_phi.py       | DM.AXION.PENTAGON.01 — the ‘unmapped’ icosahedral/golden $E_8$ structure surfaces in the ONE external cosmological input $\theta_i$ , answering “why does idle $E_8$ structure exist?” for the one case where it has a job. [E] because $N_{\text{fam}}=g_{\text{car}}-2$ , the spine quotient $\theta_i=\pi N_{\text{fam}}/g_{\text{car}}=(g_{\text{car}}-2)\pi/g_{\text{car}}$ is EXACTLY the interior angle of the regular $g_{\text{car}}$ -gon; for $g_{\text{car}}=5$ the PENTAGON, $\theta_i=3\pi/5=108^\circ$ (the carrier polygon, not a bare rational multiple of $\pi$ ). [E] its cosine is golden: $\cos(3\pi/5)=(1-\sqrt{5})/4=-1/(2\varphi)$ , partner $2\cos(2\pi/5)=1/\varphi=\varphi-1$ , $\varphi=2\cos(\pi/5)=(1+\sqrt{5})/2$ . [E] the golden character is UNIQUE to $g_{\text{car}}=5$ : among small $n$ -gons only $n=5$ has an irrational interior-angle cosine ( $n=3, 4, 6$ give $1/2, 0, -1/2$ ), so $\theta_i$ is golden BECAUSE the carrier is 5 (P2). [C] a re-reading bridging v354/v313 (the unmapped $g_{\text{car}}=5$ golden signature) to v211 ( $\theta_i=3\pi/5$ , the one external input): it REFINES v354 from “ $\varphi$ in no readout” to “ $\varphi$ touches only the [C] spine misalignment angle”, a geometric motive for the spine over the hilltop $\sim 170^\circ$ ; it does NOT upgrade DM.AXION.SPINE.01 (stays [C]) and closes no gate. [E][C]                                                                                                                                                                                                                                                               |
| v430_other_side_reverse_audit.py | E8.OTHERSIDE.AUDIT.01: the ‘other side of the seam’ (the double-cover deck / conjugate sheet $S^-$ ) audited against $E_8$ 's UNMAPPED Casimir degrees — the sheet/deck complement of v354/v355, answering “is the leftover where the second sheet lives?” with a disciplined NEGATIVE. [E] DECK = DEGREE-2: the one-sided cover contributes $ \mathbb{Z}_2 =2$ (the $1/2$ in $c_3=1/(2\cdot 4\pi)=1/(8\pi)$ , v58/v216); $2=\min(E_8 \text{ degrees})$ = the metric, one of the matched primary readouts $\{2, 8, 30\}$ (v354), NOT one of the unmapped $\{12, 14, 18, 20, 24\}$ . [E] TWO SHEETS = 128-SPINOR: $\dim S^+=\dim S^-=16$ , the spinor block $128=\text{rank} \cdot \dim S^+=8\cdot 16=2^{\text{rank}-1}=\sum \text{deg}$ , the spinor half of $248=120+128$ ; $S^-$ the conjugate $(\overline{16}, \overline{4})$ , $128=2\cdot 64$ , not a spare singlet. [E] FORCED-DISJOINT: the sheet/deck integer set $\{2, 16, 32, 128\}$ has EMPTY intersection with $\{12, 14, 18, 20, 24\}$ , its only degree-alphabet contact the matched 2. [O] DISCIPLINED DECLINE: each unmapped degree needs an UNFORCED coefficient from the sheet atoms and admits $\geq 2$ readings (the v355 discriminator) — no forced sheet $\rightarrow$ unmapped-degree identity. [E] ‘ $S^-=\text{DM}$ ’ DOWNGRADED + WIMP NO-GO: v227 replaced the over-strong ‘ $S^-$ is dark matter’; $128=(16, 4)+(\overline{16}, \overline{4})$ is the SAME matter spinor (no spare singlet), DM is the determinant-line axion (a phase). [O] the only live ‘other side’ question (the 128 phase/glue dark sector, v227) concerns MATCHED structure, not the unmapped degrees [E][O] |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v431_e8_degree_ladder.py         | <p>E8.DEGREE.LADDER.01: the reverse-audit ‘unmapped’ <math>E_8</math> Casimir degrees are NOT diffuse overhead but the forced two-family decomposition <math>\deg(E_8)=6\cdot\text{spine}\{2, 3, 4, 5\} \sqcup (\{2\} \cup \det\text{-ladder}\{8, 14, 20\})</math> — the structural complement of v354/v355/v430. [E] TWO-FAMILY SPLIT FORCED BY <math>30=2\cdot3\cdot5</math>: the <math>E_8</math> exponents are the <math>\varphi(30)=8</math> totatives of <math>h=30=2N_{\text{fam}}g_{\text{car}}</math> (coprime to 6 <math>\Rightarrow \pm 1 \pmod 6</math>), so the degrees occupy ONLY the residue classes <math>\{0, 2\} \pmod 6</math>. [E] <math>6k</math> family <math>\{12, 18, 24, 30\}/6=\{2, 3, 4, 5\}</math> = the v91 spine <math>\{e_3, e_1, e_2, p_0\}(a=(1, 1, 2))</math>. [E] <math>6k+2</math> family <math>\{2, 8, 14, 20\}</math>: <math>\{8, 14, 20\}=(\det R, \det C, \det L)=</math> the winding line <math>\det M(s, 0)=6s+8</math> of the flavor diamond (v135), <math>C=R+Q \text{ diag}(1, 0, 0)</math>. [E] ‘<math>18=6N_{\text{fam}}</math>’ is NOT a holdout (spine family, not on the det-ladder). [E] SPECIAL TO <math>E_8</math> among the simply-laced exceptionals (<math>E_6/E_7/D_5</math> fail the clean <math>\{0, 2\} \pmod 6</math> split). [C] HONEST v355 LINE: the arithmetic decomposition is exact, but the FUNCTORIAL claim ‘<math>6k+2</math> Casimir stratum = flavor sheet operators’ needs a representation-theoretic map ([C]); 12, 24 admit two canonical readings each, so this is a STRUCTURE theorem, not a forced functorial flavor map — it reclassifies v354 overhead to zero orphan degrees, closes no gate [E][C]</p> |
| v432_overdet_floor.py            | <p>OVERDET.FLOOR.01: the UNCONDITIONAL improbability floor + the <math>L1 \leftrightarrow L2</math> bridge — the defensible number that survives even if a skeptic REJECTS the declared formula grammar, complementing the conditional null model (v100) and the multiply-vs-compress framework (v427/v428). [E] DISJOINT PIECES (v428): compression removed (v427’s seven readouts are one <math>(2, 3, 5)/E_8</math> object, NOT multiplied); what multiplies is the input ‘8’ forced FOUR ways <math>\{\text{rank } E_8, h(D_5)=2(g_{\text{car}}-1), \varphi(30), \text{Milnor}(2, 3, 5)\}</math> plus the FOREIGN witness <math>\alpha^{-1} \sim 137</math> (prime, outside <math>(2, 3, 5)</math>). [C] CONSERVATIVE FLOOR: multiplying ONLY across disjoint pieces (input over-determination <math>\times</math> the <math>\alpha</math> grammar census <math>1/94500</math> (v100) <math>\times</math> the <math>\varphi_0^{\text{ret}}</math>-seed cluster counted ONCE <math>\times</math> one downstream witness) the floor stays <math>\leq 10^{-6}</math> across a grid of generous assignments, nominal <math>\sim 10^{-10}</math> — ‘extraordinary’ WITHOUT the declared grammar. [E] THE BRIDGE: the floor (<math>\sim 10^{-10}</math>) sits <math>\sim 20</math> orders ABOVE the conditional <math>10^{-30.7}</math> (v100); that gap = the evidential value of proving the FORMS forced, so L1 (ALPHA.QUILLEN.EXACT.01, v382) and L2 (this floor) are the SAME lever. [C] HONEST SCOPE: bounds ONLY “is it numerology?”, NOT the physics bridge (firewall v187); a conservative FLOOR, not a posterior [E][C]</p>                                                       |
| v433_alpha_quillen_heatkernel.py | <p>ALPHA.QUILLEN.PROGRESS.02: a <i>second honest step</i> on the external target ALPHA.QUILLEN.EXACT.01 (v382) – it GROUNDS and CONNECTS, it does NOT close it; ALPHA.QUILLEN.EXACT.01 stays [O] (external math, type A, v384), <math>\alpha^{-1}</math> stays [E]. [E] a solvable 4D model (flat <math>\Delta = -\partial^2 + m^2</math> on <math>T^4</math>) reaches the <math>a_4</math> (<math>t^0</math>) conformal-anomaly order: <math>a_4 = Vm^4/(2(4\pi)^2)</math> NON-ZERO – the order v391’s 1D circle toy (<math>a_0, a_1</math> only) could not reach. [E] it is the order v342 grounds (Gilkey <math>a_4</math> gauge-curvature <math>30/360 = 1/12</math>), unifying v391 (a <math>\zeta</math>-det variation IS heat-kernel data) with v342 (the term IS the Gilkey <math>a_4</math>). [E] <math>(4\pi)^{-2} = 4c_3^2</math> is <math>c_3</math>-built. [E] the v382 split re-verified at <math>\alpha^{-1} = 137.0359992</math>. [O] NOT CLOSED: the actual seam <math>a_4</math> (<math>= 8b_1c_3^6</math>) and the cubic <math>\alpha^3</math> Chern moment stay open (v384); the exact seam <math>F</math>-normalisation stays [C] (v342). Grounds/connects, does not close [E][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

*continued on next page*

| Script                             | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v434_alpha_quillen_betafunction.py | <p>ALPHA.QUILLEN.PROGRESS.03: a <i>third honest step</i> on ALPHA.QUILLEN.EXACT.01 (v382) – it settles the three residuals named after v433 and shows they are NOT three independent problems; the target stays [O], <math>\alpha^{-1}</math> stays [E]. [E] <math>b_1</math> IS THE U(1) <math>a_4</math> HEAT-KERNEL COEFFICIENT (the <math>\beta=a_4</math> theorem): from the carrier hypercharge content with spin weights (<math>\frac{2}{3}</math> Weyl, <math>\frac{1}{3}</math> complex scalar), <math>\sum \frac{2}{3}Y_f^2 + \frac{1}{3}Y_s^2 = 41/6</math> (SM), <math>(3/5) \cdot \text{that} = 41/10 = b_1</math> (GUT) – the <math>b_1</math> in <math>8b_1c_3^6</math> is the <math>a_4</math> content coefficient, not a fitted multiplicity (same number as the <math>\beta</math>, v159/v246; same KIND as the <math>\alpha^2</math> Calderón <math>a_4</math>, v342). [E] <math>8b_1c_3^6 = b_1 \cdot (\text{rank } E_8) \cdot c_3^6</math> (rank 8 = <math>\chi=2</math> boundary, v216; <math>c_3^6</math> six insertions, v342). [C] residual (1) “exact <math>a_4 = 8b_1c_3^6</math>” <math>\equiv</math> residual (3) “seam <math>F</math>-normalisation” – ONE obligation. [E] residual (2) located: <math>a^3 - 2c_3^3a^2 = a^2(a - 2c_3^3)</math>, so <math>a^3</math> is the first moment of the Chern density (a level, order <math>c_3^0</math>); origin stays [O]. [E] net reduction: the EM-Ward residual is <math>1[C]+1[O]</math>, not three. [O] NOT CLOSED; <math>\alpha^{-1}</math> stays [E]. Python-only [E][C][O]</p>        |
| v435_alpha_quillen_chernlevel.py   | <p>ALPHA.QUILLEN.PROGRESS.04: a <i>fourth honest step</i> on ALPHA.QUILLEN.EXACT.01 (v382) – it attacks the SINGLE remaining [O] after v434 (residual (2), the cubic <math>\alpha^3</math> Chern level) and SHARPENS it, it does NOT close it; the target stays [O], <math>\alpha^{-1}</math> stays [E]. [E] <math>\pi</math>-POWER / METRIC-INDEPENDENCE TEST: the three closure coefficients carry <math>\pi</math>-powers exactly <math>\{0, 3, 6\} = c_3</math>-orders (<math>k_0 = 1 \rightarrow \pi^0</math>; <math>-2c_3^3 = -1/(256\pi^3) \rightarrow \pi^3</math>; <math>-8b_1c_3^6 = -41/(327680\pi^6) \rightarrow \pi^6</math>), so the Maxwell <math>a^3</math> is the UNIQUE <math>\pi^0/c_3^0</math> (metric-INDEPENDENT) term – the signature of a topological level (a heat-kernel boundary coeff always carries the <math>(4\pi)^{-d/2}</math> measure; a level carries none). The test partitions the closure into ONE topological level (<math>a^3</math>) + TWO heat-kernel boundary terms, confirming v342/v434’s “<math>a^3</math> is a level, not a curvature integral” from a test. [C] conditional on the CS/<math>\eta</math> reading (EM1, v48), large-gauge invariance forces the level in <math>\mathbb{Z}</math> and <math>k_0 = 1</math> is the unit (minimal) level – an integer, not a free real. [O] NOT CLOSED: the EM1 CS-boundary derivation stays external (type A, v384); seam <math>F</math>-norm stays the one [C] (v434); <math>\alpha^{-1}</math> stays [E]. [E][C][O]</p>                                                 |
| v436_overdet_floor2.py             | <p>OVERDET.FLOOR.02: HARDENS OVERDET.FLOOR.01 (v432) — the “is it numerology?” floor does NOT rest on v432’s subjective chance assignments. [E] ASSUMPTION-MINIMAL FLOOR: the <math>\alpha</math> cubic-class census (v100 layer D) is PURE COUNTING — of <math>N=94500</math> complexity-matched <math>F_{U(1)}</math> variants only ONE hits the <math>4 \times 10^{-8}</math> CODATA window (the TFPT instance, <math>\alpha^{-1}=137.0359992</math>), so <math>p_\alpha \leq 1/94500 = 1.06 \times 10^{-5} \sim 4.40\sigma</math> with NO subjective probability, prior or multi-observable grammar. [E] MONOTONE CONCESSION LADDER: <math>-\log_{10} p</math> full scorecard+<math>\alpha \sim 30.7 \rightarrow</math> scorecard-only <math>\sim 25.8 \rightarrow \alpha</math>-census-only <math>\sim 4.98</math> (<math>= 4.40\sigma</math>); the “not chance” verdict holds at the MOST adversarial rung. [E] INDEPENDENCE: strip ALL of v432’s subjective factors (<math>0.1^3 \times 0.012 \times 0.15 = 1.8 \times 10^{-6}</math>) and the floor is still <math>4.40\sigma</math> — they only sharpen it. [C] HONEST <math>5\sigma</math> GAP: <math>5\sigma</math> (<math>p=5.7 \times 10^{-7}</math>) is crossed by the census times exactly ONE more independent factor <math>\leq 0.054</math> (the input-‘8’ four-fold over-determination or one foreign witness), stated openly. [C] FIREWALL: bounds numerology only, not the physics bridge (v187); Python-only, deliberately NOT Wolfram-mirrored (a counting bound, not an identity). [E][C]</p> |

| Script                     | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v437_e8_degree_joint.py    | <p>E8.DEGREE.JOINT.01: a CONSOLIDATION of v6/v66/v355/v431 deriving more from the <math>E_8</math> Casimir degrees WITHOUT crossing the v354/v355 anti-numerology line — no new per-degree coincidence, only a joint lock. [E] <math>E_8</math> IS FIXED BY ITS DEGREE MULTISSET: from <math>\deg(E_8)=\{2, 8, 12, 14, 18, 20, 24, 30\}</math> alone — <math>\text{rank}=\#\deg=8</math>, <math>h=\max=30</math>, <math>\#\text{pos roots}=\sum \exp=120</math>, <math>\#\text{roots}=240</math>, <math>\dim=248</math>, <math> W =\prod \deg=696,729,600</math>, <math>\sum \deg=128=2^7=\dim S^+</math>. [E] THE JOINT QUADRATIC: the two structural integers <math>(g_{\text{car}}, N_{\text{fam}})</math> are the UNIQUE root pair of <math>x^2 - (\text{rank } E_8)x + (h/2) = x^2 - 8x + 15 = (x-3)(x-5)</math> — <math>\text{sum}=\text{rank } E_8=8</math> (<math>\text{rank-fill}, v6</math>), <math>\text{product}=h/2=15=g_{\text{car}}N_{\text{fam}}</math> (<math>2g_{\text{car}}N_{\text{fam}}=h, v431</math>); <math>\{3, 5\}</math> the unique factor pair of 15 summing to 8, so BOTH are forced together by two degree-invariants. [E] the three mapped degrees <math>\{2, 8, 30\} = \min/\text{rank}/\max</math> (the canonical invariants); <math>g_{\text{car}}=5=\max</math> prime of 30. [E] DISCIPLINE: no new per-degree mining; the five non-primary degrees keep their v431 homes. Exact integer/lattice, mirrored in wolfram. [E][C]</p>                                                                                                                                                                                                      |
| v438_seam_hsmi_borchers.py | <p>SEAM.EQUIV.BW.HSMI.01: the half-sided modular inclusion (Borchers/Wiesbrock) as an INTRINSIC Bisognano–Wichmann route for face (ii) of SEAM.EQUIV.01 — geometric modular flow WITHOUT presupposing covariance. [E] STANDARD-PAIR ALGEBRA (ladder, exact): boost <math>K=\text{diag}(n)</math> and translation <math>P</math> (raising shift) satisfy <math>[K, P]=P</math> and the Borchers scaling <math>\Delta^{it}P\Delta^{-it}=e^{-t}P</math> (the <math>ax+b/\text{Moebius}</math> relation). [E] BW REFLECTION: <math>J(n\rightarrow -n)</math> gives <math>J^2=I</math>, <math>JKJ=-K</math> (<math>u_\Theta=J</math>) and <math>JPJ=P_-</math> (the opposite-chirality translation), the standard-pair reflection <math>JU(s)J=U(-s)</math>. [E] POSITIVE ENERGY: in the unitary lowest-weight <math>sl(2, \mathbb{R})</math> rep the line translation <math>P_{\text{line}}=L_0-(L_++L_-)/2</math> is POSITIVE (<math>\min \text{eig} &gt; 0</math>), the positive-energy generator the <math>c_3</math> one-sided origin demands; the boost direction is the indefinite negative control. [C] SYNTHESIS: <math>P\geq 0 + [K, P]=P + J</math> is a Longo STANDARD PAIR / +half-sided modular inclusion (Wiesbrock), so by Borchers the seam modular flow is geometric INTRINSICALLY (complementary to Adamo–Giorgetti–Tanimoto, arXiv:2508.07109); face (ii) becomes a STRUCTURE consequence, not a state condition. [C][O] assembling the finite algebra and the positive-energy rep into ONE continuum standard pair is the continuum existence (the same wall as MMST/NPW26, v336/v424); SEAM.EQUIV.01 stays [O]. Python-only (numpy/scipy). [E][C][O]</p> |
| v439_seam_lieb_robinson.py | <p>SEAM.EQUIV.CONTINUUM.LR.01: the Lieb–Robinson/Nachtergaele–Sims continuum-existence MOTOR for the gapped seam collar — grounds the BULK half of the cited MMST existence (v336) in the explicit v367 <math>p+ip</math> model. [E] UNIFORM GAP: <math>\Delta(N)=\text{const}&gt;0</math> across <math>N=20..160</math> (the lattice image of the OS transfer gap <math>6\log\frac{3}{2}&gt;0, v302/v329</math>). [E] EXPONENTIAL CLUSTERING: <math> \langle c_i^\dagger c_j \rangle  \sim e^{-r/\xi}</math> with <math>\xi</math> finite and STABLE across <math>N</math> (gapped <math>\Rightarrow</math> Hastings–Koma decay), the <math>N</math>-independent locality. [E] LIEB–ROBINSON LIGHT CONE: the single-particle propagator <math> (e^{-iHt})_{ij} </math> is confined to <math> i-j  \lesssim v_{\text{LR}}t</math> with finite <math>v_{\text{LR}}</math> (<math>\sim 2t</math>), exponentially small beyond the cone. [C] NACHTERGAELE–SIMS LIFT: uniform gap + finite LR velocity <math>\Rightarrow</math> exponential clustering with <math>N</math>-independent <math>\xi</math> AND existence+uniqueness of the thermodynamic-limit ground state with a finite light cone — derived for OUR collar, not imported. [C][O] the bulk thermodynamic limit EXISTS by Lieb–Robinson; SEAM.EQUIV.01 stays [O], the open analytic step narrowed to the CHIRAL massless EDGE scaling limit (the <math>c=8</math> <math>(E_8)_1</math> CFT), distinct from the bulk limit. Python-only (numpy/scipy). [E][C][O]</p>                                                                                                                                             |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v440_seam_lto_rp_beta.py          | SEAM.EQUIV.LTORP.BETA.01: the $\beta$ -interpolation connecting the NPW26-PROVEN trace case ( $\beta=0$ ) to the seam's $\beta=1$ KMS case along an obstruction-free homotopy — upgrading the single-point v426 witness for v424 sub-step (ii) to a PATH argument. [E] $\beta$ -INDEPENDENT (LTO-RP) DATA: $\Theta K \Theta = -K$ ( $u_\Theta = J$ ) and $[\rho, K]=0$ are conditions on $K$ alone, $\beta$ -independent. [E] THE KMS PATH: $C_\beta = 1/(1+e^{\beta K})$ has $\beta=0 \rightarrow C=\frac{1}{2}I$ (the NPW26 TRACE state), $\beta=1 \rightarrow$ the seam KMS state, $\beta \rightarrow \infty \rightarrow$ the ground-state projection; at every $\beta$ $\Theta C_\beta \Theta = 1-C$ (reflection), $[\rho, C_\beta]=0$ (mu4), $0 \leq C_\beta \leq 1$ (valid covariance/RP). [E] NO OBSTRUCTION: $\beta \mapsto C_\beta$ is norm-continuous and stays in the (LTO-RP)-valid set — a continuous homotopy from the proven trace endpoint to the seam KMS point, no topological wall. [E] NEG CONTROLS: a reflection-EVEN $K'$ breaks $\Theta C_\beta \Theta = 1-C$ for $\beta > 0$ (the trace endpoint is degenerate); an off-mu4-block $K$ breaks $[\rho, C_\beta]$ . [C][O] a PATH argument for v424 sub-step (ii), stronger than the single point of v426; SEAM.EQUIV.01 stays [O] (closedness of (LTO-RP) along the path in the continuum is the residual). Python-only (numpy/scipy). [E][C][O]                                                                                                                             |
| v441_seam_applicability_ledger.py | SEAM.EQUIV.APPLICABILITY.01: the applicability ledger — a hypothesis-by-hypothesis audit of the THREE external theorems the seam keystone cites (MMST scaling limit, NPW26 (LTO-RP), Adamo–Giorgetti–Tanimoto covariance), isolating the SINGLE imported analytic fact. [E] MMST HYPOTHESES: $D=16$ Majoranas ( $= 2^{g_{\text{car}}-1}$ ), $c=8$ ( $= g_{\text{car}} + N_{\text{fam}}$ ), rank $E_8=8$ , range rank $\leq c \leq D$ reads $8 \leq 8 \leq 16$ , gapped ( $6 \log \frac{3}{2} > 0$ ), quasi-free CAR — all internal computed facts. [E] NPW26: (LTO-RP) $= u_\Theta = J$ , gap, $\mathbb{Z}_2$ reflection, mu4 clock, $[\rho, K]=0$ internal (v424/v426/v440); the seam is invertible $ \det \text{Cartan } E_8  = 1 + \beta = 1$ KMS, OUTSIDE NPW26's topological/trace bucket ( $ \det =4$ ) — a TEMPLATE, not a direct import. [E] ADAMO–GIORGETTI–TANIMOTO (arXiv:2508.07109): DHR reps of nets extending loop-group/Virasoro are AUTOMATICALLY positive-energy + diff-covariant; the seam net extends $(D_5)_1 \times (A_3)_1$ (v154), so covariance is a CONSEQUENCE — the v215 circularity is defused, covariance downgraded ASSUMPTION $\rightarrow$ [E]. [E] of 12 audited hypotheses, 11 are internal [E] and exactly 1 external — the continuum EXISTENCE of the chiral massless scaling limit (MMST/v336, Lean FORM.SEAM.MMST.01). [C][O] external dependence pinned to ONE analytic fact; SEAM.EQUIV.01 stays [O]. Python-only (a structural/arithmetic audit; the dets Wolfram-mirrored via v89/v281/v422). [E][C][O] |
| v442_seam_rigidity_uniform.py     | SEAM.RIGIDITY.UNIFORM.01: the uniform-in- $N$ hardening of the Seam State Rigidity Theorem (v398) — the band-limited rigidity is NOT a small- $N$ artifact. [E] EXACT UNIFORM 4-SECTOR COMMUTATION: $\rho = \text{diag}(i^n)$ has EXACTLY 4 distinct eigenvalues $\{1, i, -1, -i\}$ for all $N$ , and a genuinely character-block-diagonal $K$ (random Hermitian within each $n \bmod 4$ class, not merely diagonal) has $[\rho, K]=0$ EXACTLY for $N=4..256$ (extends v398's $N \leq 64$ ). [E] UNIFORM GAP: $\Delta(N) = \text{const} > 0$ across $N=20..160$ (the Nachtergaele–Sims uniform gap, shared with v439). [E] $N$ -INDEPENDENT RIGIDITY BOUND: a FIXED local clock-breaking perturbation (single off-mu4-block Hermitian entry) gives $\ [\rho, V]\ =2$ EXACTLY for all $N$ — a uniform lower bound; any fixed-size clock-breaking is detected with $N$ -independent strength. [E] NEG CONTROL: a clock-PRESERVING (same-sector) perturbation gives $\ [\rho, V']\ =0$ ; an order-2 clock has only 2 distinct eigenvalues — the ORDER of the clock (the four Gauss–Bonnet marks) is the discriminator, uniformly in $N$ . [C][O] the band-limited rigidity of v398 is uniform in $N$ ; SEAM.RIGIDITY.01/SEAM.EQUIV.01 stays [O]: that RP+gap+holomorphy FORCE $\Lambda_\Sigma$ block-diagonal on the full $L^2$ (vs merely permit) is the cited rigidity/MMST step. Python-only (numpy). [E][C][O]                                                                                                                                    |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v443_seam_e8_discriminator.py | <p>SEAM.E8.DISCIMINATOR.01: the empirical/structural DISCRIMINATOR bundle (mode D of the v347 closure-mode classification) — concrete FALSIFIABLE kill tests separating the claimed seam <math>= (E_8)_1</math> from the nearest <math>c=8</math> rival <math>SO(16)_1=(D_8)_1</math>. [E][X] PRIMARY/GSD: <math> \det \text{Cartan}(E_8) =1</math> (ONE primary, holomorphic) vs <math> \det \text{Cartan}(D_8) =4</math> (FOUR primaries <math>1, v, s, c</math>); torus GSD <math>= \# \text{primaries} = 1</math> vs <math>4</math> — a seam with <math>\text{GSD} &gt; 1</math> falsifies <math>(E_8)_1</math>. [E][X] CURRENT/THETA: level-1 current count <math>\dim E_8=248</math> vs <math>\dim SO(16)=120</math>; the <math>E_8</math> lattice theta has 240 norm-2 roots (<math>= 112</math> integer + 128 spinor, computed) vs <math>D_8</math>'s 112 — current spectrum and lattice theta DIFFER. [E] <math>c=8</math> IS NOT A DISCRIMINATOR: both have <math>c=8</math> (the v277 ambiguity); only the order-4 <math>\mu_4</math> condensation + <math>\det K=1</math> (the genus-1 statement, v90) selects <math>E_8</math>. [E] NON-VACUITY: the discriminators all fire on the rival (<math>\det 4 \neq 1</math>, currents <math>120 \neq 248</math>, roots <math>112 \neq 240</math>). [X][C] mode D realised as concrete kill tests; SEAM.EQUIV.01 stays [O] (the discriminators distinguish the TARGET but do not PROVE the seam realises it). Python-only (numpy; the dets Wolfram-mirrored via v89/v281/v422). [E][C][O][X]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| v444_seam_edge_scaling.py     | <p>SEAM.EQUIV.CONTINUUM.EDGE.01: the CHIRAL EDGE scaling-limit MOTOR — the edge half of the one SEAM.EQUIV.01 continuum residual, attacking exactly the step v439 left open. On the SAME explicit v367/v368 <math>p+ip</math> collar it shows the lattice edge carries the kinematic AND conformal data of a chiral <math>c=\frac{1}{2}</math> Majorana CFT, converging under refinement. [E] CHIRAL LINEAR EDGE DISPERSION: the in-gap branch is linear near its zero-crossing (top <math>v=0.983</math>, <math>R^2=0.9999</math>) and the two boundaries carry OPPOSITE velocities — one chiral Majorana per edge (relativistic, chiral kinematics). [E] ALGEBRAIC EDGE TWO-POINT: the equal-time edge correlator decays as <math>r^{-\eta}</math> with <math>\eta=1.00</math> (the chiral free-fermion CFT exponent) — a CRITICAL edge. [E] EXPONENTIAL BULK (neg control): the bulk-row correlator decays exponentially (<math>\xi \sim 1.1</math>) — only the edge is critical, so the power law is the edge CFT, not a geometric artefact. [E] TRIVIAL-PHASE NEG CONTROL: <math>M=3</math> (no edge, v368) has an exponential edge-row — the algebraic decay is the topological edge, not the boundary geometry. [E] SCALING-COLLAPSE / CONVERGENCE: <math>\eta</math> is <math>N</math>-stable (<math>1.001 \pm 0.007</math>) and the edge correlator profile is Cauchy-convergent under refinement (successive spread shrinks <math>0.028 \rightarrow 0.013</math>, <math>N_x=36..60</math>) — an existing scaling limit, the edge analogue of v439's bulk thermodynamic limit. [C] EDGE CENTRAL CHARGE: <math>\eta=1 \Leftrightarrow</math> one chiral Majorana (<math>c=\frac{1}{2}</math>) per edge, so the <math>N_{\text{Maj}}=16</math>-copy carrier has a chiral <math>c_-=8</math> edge CFT (<math>= (E_8)_1</math>, <math>c_-=g_{\text{car}}+N_{\text{fam}}</math>). [C][O] grounds the EDGE half of the cited MMST scaling limit (v336) the way v439 grounds the bulk; with both halves the one continuum residual is grounded and pinned to a single cited theorem; SEAM.EQUIV.01 stays [O] (the rigorous uniform-convergence theorem is not supplied). Python-only (numpy). [E][C][O]</p> |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v445_seam_rigidity_forcing.py | <p>SEAM.RIGIDITY.FORCING.01: the rigidity FORCING theorem — upgrades v442’s “block-diagonal PERMITS commuting” to “commuting with the order-4 clock FORCES block-diagonal”, isolating the single remaining physical premise. [E] FORCING (commute <math>\Leftrightarrow</math> block-diagonal, EXACT): for <math>\rho = \text{diag}(i^n)</math>, <math>[\rho, K]=0</math> iff <math>K_{ij}=0</math> whenever <math>i \not\equiv j \pmod 4</math> — verified ENTRYWISE, swept <math>N=4..128</math> (the converse of v442). [E] EXACT COMMUTANT DIMENSION: <math>\dim\{K : [\rho, K]=0\} = \sum_s n_s^2</math> (the four sector sizes), verified as the <math>\text{ad}_\rho</math> nullspace; a PROPER subspace of the <math>N^2</math> algebra (<math>N=16</math>: <math>64 &lt; 256</math>) — a genuine quantitative restriction. [E] OFF-BLOCK <math>\Leftrightarrow</math> NON-COMMUTING: every off-block matrix unit <math>E_{ij}</math> has <math>\ [\rho, E_{ij}]\  =  i^i - i^j  \geq \sqrt{2} &gt; 0</math> — zero slack. [E] THE ORDER IS THE DISCRIMINATOR: the order-4 clock gives 4 sectors (<math>\dim \sum n_s^2(4)</math>), the order-2 clock <math>\text{diag}((-1)^n)</math> a STRICTLY LARGER commutant (<math>N=16</math>: <math>64</math> vs <math>128</math>) — the four Gauss–Bonnet marks (order <math>4= \mu_4 =h(A_3)</math>) force strictly more structure than two; only the index-4 extension is <math>(E_8)_1</math> (<math>\det 1</math>; v281/v154/v351). [E] NONDEGENERACY: exactly 4 distinct eigenvalues <math>\{1, i, -1, -i\}</math> for all <math>N \geq 4</math>. [C] SYNTHESIS (force, not permit): commuting with the order-4 <math>\mu_4</math> clock is EQUIVALENT to <math>\mu_4</math>-block-diagonality (iff, exact, uniform in <math>N</math>), so RP-definability (v54/v398) + clock-invariance FORCE the block-diagonal <math>\Lambda_\Sigma</math> — v442’s “permit” upgraded to “force”. [C][O] the single residual is now precisely “transfer in commutant” (clock-invariance = QGEO.SYM.01, v323/v335); SEAM.RIGIDITY.01/SEAM.EQUIV.01 stays [O]. Python-only (numpy; the det facts Wolfram-mirrored via v89/v281/v422). [E][C][O]</p> |
| v446_seam_clock_invariance.py | <p>SEAM.RIGIDITY.CLOCKINV.01: DERIVING clock-invariance (“transfer in the commutant”) from RP-symmetry, closing v445’s single residual one notch further — the residual drops from an OPERATOR commutation to the STRUCTURAL <math>\mu_4</math>-symmetry of the seam RP data. [E] OS RECONSTRUCTION INHERITS THE SYMMETRY: for a <math>\mu_4</math>-invariant RP covariance <math>([\rho, C(t)]=0)</math>, the OS canonical transfer <math>\Lambda=C(1)C(0)^{-1}=e^{-h}</math> (the transfer FIXED by RP+reflection, v54) has <math>[\rho, \Lambda]=0</math> — swept <math>N=4..32</math> over random block-diagonal <math>h</math>. [E] SHARPNESS / NEG CONTROL: a <math>\mu_4</math>-BREAKING covariance gives <math>[\rho, \Lambda] \neq 0</math> — iff-sharp, so the inheritance is non-vacuous. [E] CONTRACTION / OS-VALIDITY: <math>\Lambda</math> has spectrum in <math>(0, 1]</math> (a positive contraction, the physical canonical transfer). [E] MODULAR (Tomita–Takesaki): the free modular Hamiltonian <math>K=\log((1-C)C^{-1})</math> (the v258 formula) of the <math>\mu_4</math>-invariant state has <math>[\rho, K]=0</math> (the clock commutes with modular flow), the breaking control <math>[\rho, K] \neq 0</math>. [C] SYNTHESIS: <math>[\rho, \Lambda_\Sigma]=0</math> is a CONSEQUENCE of <math>\mu_4</math>-invariance of the seam RP data (the four Gauss–Bonnet marks, v216/v323) via the OS reconstruction (v54) + the modular fact (v258), NOT an extra assumption; with v445 (commute <math>\Leftrightarrow</math> block-diagonal), RP-definability PLUS the marks FORCE the block-diagonal <math>\Lambda_\Sigma</math>. [C][O] the residual reduces from an operator commutation to “the seam RP data is <math>\mu_4</math>-symmetric” (QGEO.SYM.01); the continuum Tomita–Takesaki implementation on the full <math>L^2</math> is the cited backbone. SEAM.RIGIDITY.01/SEAM.EQUIV.01 stays [O]. Python-only (numpy/scipy). [E][C][O]</p>                                                                                                                                                                                                                  |

| Script                      | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v447_seam_edge_chern.py     | <p>SEAM.EQUIV.EDGE.CHERN.01: an INDEPENDENT (topological) reading of the edge <math>c_- = 8</math>, corroborating v444's correlator route via the bulk-edge correspondence on the same v367/v368 <math>p+ip</math> collar. [E] INTEGER CHERN NUMBER: the <math>M=1</math> collar lower band has Chern <math>C=+1</math> (the Fukui-Hatsugai-Suzuki lattice link-variable method, an EXACT integer, no fit) — one chiral channel per copy. [E] TRIVIAL-PHASE NEG CONTROL: <math>M=3</math> (v368) has <math>C=0</math> (no chiral edge), and <math>M=-1</math> gives <math>C=-1</math> (opposite chirality, matching v444's opposite per-edge velocities). [E] BULK-EDGE CORRESPONDENCE: the open strip carries EXACTLY <math> C =1</math> in-gap edge branch crossing zero per boundary in the <math>M=1</math> phase, 0 in the trivial phase — the chiral edge channel count = <math> C </math>. [E] LI-HALDANE: the half-cut bulk ground state's single-particle entanglement spectrum has in-gap modes at <math>1/2</math> in the topological phase and NONE in the trivial — the entanglement edge tracks the physical edge. [C] EDGE CENTRAL CHARGE: <math>c_- = N_{\text{Maj}} \cdot \frac{1}{2} \cdot  C  = 16 \cdot \frac{1}{2} \cdot 1 = 8 = g_{\text{car}} + N_{\text{fam}}</math>, from the Chern integer + bulk-edge correspondence — the SAME <math>c_- = 8</math> as v444's correlator route, from a logically independent (topological) observable. [C][O] corroborates v444's edge <math>(E_8)_1</math> reading; SEAM.EQUIV.01 stays [O] — the topology fixes <math>c_-</math> and the channel count but not the cited continuum existence theorem. Python-only (numpy). [E][C][O]</p>                                                                                                                                                                           |
| v448_seam_edge_fourpoint.py | <p>SEAM.EQUIV.EDGE.FOURPOINT.01: pinning the ONE external MMST fact empirically — the edge FOUR-point function is quasi-free and conformally convergent, extending v444's two-point scaling limit to the next order. [E] QUASI-FREE / WICK (CAR hypothesis): the ground-state correlation matrix is an exact projector <math>G^2=G</math> (<math>\sim 10^{-13}</math>), so the state is quasi-free and all <math>n</math>-point functions are Wick/Pfaffian sums of the two-point — the MMST quasi-free CAR hypothesis (ledger entry 5) literally holds on the collar (structural: the BdG state is free). [E] FOUR-POINT CAUCHY CONVERGENCE: the edge four-point cross-ratio <math>Q=[G_{01}G_{23}]/[G_{02}G_{13}]</math> at COMMENSURATE positions <math>(1, 2, 4, 7) \cdot (N_x/12)</math> is Cauchy-convergent under refinement (successive spread shrinks, <math>N_x=36..60</math>) — the four-point converges, extending v444's two-point scaling-collapse. [E] CONFORMAL FOUR-POINT FORM: <math>Q</math> converges to the free-fermion CONFORMAL cross-ratio <math>\sin(5\pi/12)/\sin(\pi/12)=2+\sqrt{3} \approx 3.732</math> (chord distance <math>d(r)=(N_x/\pi)\sin(\pi r/N_x)</math>) — the edge four-point has the chiral-CFT cross-ratio structure (<math>\eta=1</math>), not just the two-point. [E] BULK NEG CONTROL: the bulk-row four-point is orders of magnitude off the conformal value (exponential decay, gapped) — only the EDGE four-point is conformal. [C] the one external MMST fact (continuum existence of the chiral scaling limit) is now empirically supported at BOTH two-point (v444) and four-point order on our explicit collar; every measured <math>n</math>-point converges to its conformal limit. SEAM.EQUIV.01 stays [O] — the rigorous MMST uniform-convergence theorem (v336) is the cited backbone. Python-only (numpy). [E][C]</p> |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v449_seam_mmst_uniform.py      | <p>SEAM.EQUIV.MMST.UNIFORM.01: uniform-in-<math>N</math> control of the edge scaling limit — the empirical content of the cited MMST uniform-convergence theorem, strengthened, on the same v367/v368 <math>p+ip</math> collar. [E] CROSS-RATIO A CONVERGES: the edge four-point <math>Q(1, 2, 4, 7)/12 \rightarrow \sin(5\pi/12)/\sin(\pi/12) = 2+\sqrt{3}</math>, the deviation shrinking monotonically under refinement (<math>N_x=36, 48, 60</math>). [E] CROSS-RATIO B (independent positions): <math>Q(1, 3, 5, 9)/12 \rightarrow</math> its OWN conformal value 2 — a SECOND observable with a DIFFERENT limit, so the convergence is not a single tuned point. [E] UNIFORM <math>1/N</math> RATE: <math> Q(N)-Q_\infty  \cdot N \leq 4</math> for BOTH cross-ratios and every <math>N_x \in \{36, 48, 60\}</math> — one <math>N</math>-independent constant bounds the deviation across two independent observables, the empirical hallmark of uniform-in-<math>N</math> convergence. [E] BULK NEG CONTROL: the bulk-row cross-ratio is off-scale (gapped, exponential) — only the EDGE converges. [C][O] the MMST uniform-convergence HYPOTHESIS is empirically satisfied on the collar (two-point v444, four-point v448, and now multi-observable uniform rate); SEAM.EQUIV.01 stays [O] — the abstract continuum existence theorem (v336) is strengthened in evidence, not replaced by a proof. Python-only (numpy). [E][C]</p> |
| v450_seam_edge_entanglement.py | <p>SEAM.EQUIV.EDGE.ENTANGLEMENT.01: a THIRD independent reading of the edge <math>c_-=8</math> — the Calabrese–Cardy entanglement scaling <math>c=1/2</math> per Majorana (after v444 correlator, v447 topology). [E] CALABRESE–CARDY LAW: the block entanglement entropy of the critical XX (Dirac) chain fits <math>S=(c/3)\ln[(L/\pi)\sin(\pi\ell/L)]+\text{const}</math> with <math>c_{\text{Dirac}}=1.000</math> (flat log slope) — the universal scaling-limit signature. [E] <math>c</math> PER MAJORANA = <math>1/2</math>: <math>c_{\text{Dirac}}=1=2c_{\text{Maj}}</math> (Dirac = two Majoranas), so <math>c_{\text{Maj}}=1/2</math> — the chiral CFT of one <math>p+ip</math> edge mode (v444). [E] GAPPED NEG CONTROL: a dimerised (gapped) chain has saturating, <math>\ell</math>-independent entanglement (<math>c=0</math>) — the log growth is the CRITICAL edge CFT. [C] EDGE CENTRAL CHARGE: <math>c_-=N_{\text{Maj}} \cdot c_{\text{Maj}} = 16 \cdot \frac{1}{2} = 8 = g_{\text{car}} + N_{\text{fam}}</math>, from entanglement — the SAME <math>c_-=8</math> as v444 (correlator) and v447 (topology), from a third independent observable. [C][O] three observables agree; SEAM.EQUIV.01 stays [O]. Python-only (numpy). [E][C]</p>                                                                                                                                                                                |
| v451_seam_edge_cardy_tower.py  | <p>SEAM.EQUIV.EDGE.CARDY.01: the Cardy finite-size conformal tower — the edge spectrum reproduces the EXACT Ising primary dimensions <math>\{1/16, 1/2\}</math>, on the critical Majorana ring (the v367/v368 edge universality class). [E] SPIN DIMENSION <math>h_\sigma=1/16</math>: the periodic(R)–antiperiodic(NS) ground-energy split gives <math>(E_0^R - E_0^{NS})L/(2\pi v)=0.06250</math> (<math>v=2</math>), stable across <math>L=200, 400, 800</math> — the Ising spin field. [E] ENERGY DIMENSION <math>h_\varepsilon=1/2</math>: the lowest NS pair excitation gives <math>2\varepsilon_{\min}L/(2\pi v)=0.50000</math> — the Ising energy field. [E] CONFORMAL SCALING: both dimensions are <math>L</math>-INDEPENDENT (the gaps scale exactly as <math>1/L</math>) — a conformal (gapless) spectrum, not a gapped lattice. [C] ISING IDENTIFICATION: <math>\{c, h_\sigma, h_\varepsilon\}=\{1/2, 1/16, 1/2\}</math> is the chiral Ising (free Majorana) CFT (the <math>c=1/2</math> building block, v444/v450); with <math>N_{\text{Maj}}=16</math> copies and bulk-edge (v447), <math>c_-=16 \cdot \frac{1}{2}=8=g_{\text{car}}+N_{\text{fam}}</math>. [C][O] the edge CFT is named by its central charge (v450) AND its operator content (this); SEAM.EQUIV.01 stays [O]. Python-only (numpy). [E][C]</p>                                                                                                               |

| Script                      | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v452_seam_e8_modular.py     | <p>SEAM.EQUIV.E8.MODULAR.01: the <math>(E_8)_1</math> torus modular data — one primary, <math>S</math>-invariant, <math>T</math>-phase <math>e^{-2\pi i/3}</math>, the holomorphic <math>c=8</math> signature (extends v156's <math>q</math>-expansion to the modular transformation data). [E] <math>S</math>-INVARIANCE: <math>\chi(-1/\tau)=\chi(\tau)</math> for <math>\chi=E_4/\eta^8</math> (weight 0, since <math>E_4</math> wt 4 / <math>\eta^8</math> wt 4), to <math>\sim 10^{-30}</math> — ONE primary, the <math>S</math>-matrix is [1]. [E] <math>T</math>-PHASE: <math>\chi(\tau+1)/\chi(\tau)=e^{-2\pi i/3}=e^{-2\pi ic/24}</math> (<math>c=8</math>), to <math>\sim 10^{-30}</math> — the central charge appears in the modular <math>T</math> eigenvalue. [E] LEADING POWER <math>\Rightarrow c=8</math>: <math>\chi q^{1/3} \rightarrow 1</math> so the leading power is <math>q^{-c/24}=q^{-1/3} \Rightarrow c=8=g_{\text{car}}+N_{\text{fam}}</math>. [E] HOLOMORPHIC CONSTRAINT: <math>c=8=0 \bmod 8</math> — the minimal holomorphic (single-primary) chiral central charge, the even unimodular rank-8 lattice <math>E_8</math>. [C][O] the <math>(E_8)_1</math> modular data (one primary, <math>S</math>-invariant, <math>T</math>-phase <math>e^{-2\pi i/3}</math>, <math>c=8</math>) is the torus signature of the seam net; with the edge readings (v444/v447/v450/v451) the <math>(E_8)_1</math> identity is pinned on the torus AND the edge; SEAM.EQUIV.01 stays [O] — the cited continuum existence theorem (v336) is the residual. Wolfram-mirrored (tfpt_readouts_extension.wl). [E][C]</p>                                                     |
| v453_seam_mu4_from_marks.py | <p>SEAM.RIGIDITY.MU4FROMMARKS.01: deriving QGEO.SYM.01 (<math>\mu_4</math>-symmetry of the seam RP data) from the four marks — the LAST structural premise of the rigidity chain folded into the existing realisation premise. [E] THE MARKS ARE <math>\mu_4</math>: the four Gauss–Bonnet marks are exactly <math>\{1, i, -1, -i\} = \text{roots of } z^4-1</math> (v168/v216/v323). [E] THE CLOCK PERMUTES THE MARKS: <math>z \mapsto iz</math> is a 4-cycle of order 4 (<math>1 \rightarrow i \rightarrow -1 \rightarrow -i \rightarrow 1</math>), fixing the configuration setwise (the order-4 clock of v445). [E] MOEBIUS STABILISER: <math>z \mapsto iz</math> preserves the marks' cross-ratio <math>\lambda=2</math> (in the <math>D_4</math> stabiliser, v168) — the symmetry is geometric. [E] THE FORM BASIS IS <math>\mu_4</math>-GRADED: <math>\omega_k = z^{k-1} dz / (z^4-1) \rightarrow i^k \omega_k</math> under <math>z \mapsto iz</math> (<math>k=1, 2, 3 \rightarrow \{i, -1, -i\}</math>, the three nontrivial <math>\mu_4</math> characters; weights <math>(1, 2, 3)=A_3</math> exponents = <math>\text{Spec}(Q_+)</math>) — the natural basis is <math>\mu_4</math>-graded, so any geometric datum is <math>\mu_4</math>-covariant. [C][O] QGEO.SYM.01 (“the seam RP data is <math>\mu_4</math>-symmetric”) is a CONSEQUENCE of marks=<math>\mu_4</math> (this) + QGEO.REALIZE.01 (seam = the marked geometry, the EXISTING premise), NO new premise; the rigidity chain (this <math>\rightarrow</math> v446 <math>\rightarrow</math> v445) closes modulo realisation, SEAM.EQUIV.01 stays [O]. Wolfram-mirrored (tfpt_readouts_extension.wl). [E][C]</p> |
| v454_seam_edge_virasoro.py  | <p>SEAM.EQUIV.EDGE.VIRASORO.01: the lattice realises the level-1 current algebra whose Sugawara central charge is EXACTLY 8 (G2 of the post-F next steps) — testing the cited MMST “Koo–Saleur lattice generators <math>\rightarrow</math> continuum Virasoro with the correct <math>c</math>” fact on our own free-fermion edge. [E] CASIMIR <math>c</math>: the critical complex free-fermion ring <math>E_0(L)=e_\infty L - \pi v c / (6L)</math> (Affleck–Cardy) fits <math>c_{\text{Dirac}}=1.000 \Rightarrow 1/2</math> per Majorana (parameter-free, <math>L=64..1024</math>). [E] KAC–MOODY LEVEL: the lattice <math>U(1)</math> current <math>J_n</math> has <math>\langle 0   J_n J_{-n}   0 \rangle = n</math> EXACTLY (<math>n=1..8</math>) — the affine level-1 central extension closes; a gapped (dimerised) control gives a vanishing non-linear term. [E] SUGAWARA EXACT: <math>c = \dim G / (1+h^\vee) = 8</math> for BOTH <math>SO(16)_1</math> (120/15) and <math>(E_8)_1</math> (248/31) — Wolfram-mirrored. [C] ASSEMBLY: 16 Majoranas <math>\times \frac{1}{2} = 8 =</math> the level-1 Sugawara <math>c</math>; the edge IS a <math>c_- = 8</math> level-1 current-algebra CFT. [C][O] the lattice Virasoro/current algebra with the correct central extension is realised on the explicit collar; SEAM.EQUIV.01 stays [O] (the continuum existence theorem v336 is the cited backbone). Mixed numerical (Casimir, Kac–Moody) + exact (Sugawara, Wolfram-mirrored). [E][C][O]</p>                                                                                                                                                                         |

*continued on next page*

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v455_seam_bw_uniform.py         | <p>SEAM.EQUIV.BW.UNIFORM.01: a UNIFORM-IN-<math>N</math> Tomita–Takesaki tower for the intrinsic Bisognano–Wichmann condition <math>u_\Theta=J</math> (G1 of the post-F next steps) — the inductive-limit companion to the single finite witness v426, advancing v424 sub-step (i). One-particle: <math>\Delta=e^{-K}</math>, conjugation <math>J</math>, reflection <math>\Theta</math>; BW <math>\Leftrightarrow u_\Theta=J \Leftrightarrow \Theta K \Theta = -K</math>. [E] UNIFORM BW: the reflection-odd, <math>\mu_4</math>-even, gapped collar of size <math>4m</math> (<math>m=2..32</math>, <math>N=8..128</math>) has <math>\ \Theta K \Theta + K\ =0</math> to machine precision at EVERY <math>N</math> — <math>u_\Theta=J</math> uniform. [E] UNIFORM GAP: the gap of <math>K</math> is <math>N</math>-independent (<math>6 \log \frac{3}{2} = 2N_{\text{fam}} \log \frac{3}{2}</math>) so <math>\Delta=e^{-K}</math> stays uniformly bounded away from 1 (a genuine KMS, not trace, state). [E] UNIFORM CLOCK SYMMETRY: <math>[\rho, K]=0</math> exactly at every <math>N</math>. [E] <math>N</math>-INDEPENDENT NEG CONTROL: a side-even reflection gives <math>\ \Theta K \Theta + K\ =2\ K\ </math> (a fixed per-mode margin, growing with <math>N</math>) and an off-<math>\mu_4</math> <math>K</math> breaks <math>[\rho, K]</math> at every <math>N</math> — the success is non-vacuous. [C][O] the inductive (continuum) limit inherits <math>u_\Theta=J</math>; SEAM.EQUIV.01 stays [O] (the rigorous continuum theorem NPW26/MMST v336 is the backbone). Python-only (numpy). [E][C][O]</p> |
| v456_seam_chirality_from_c3.py  | <p>SEAM.S3.FROM-P1.01: the edge chirality (<math>c_- \neq 0</math>, the S3 topological phase) is FORCED by the one-sidedness that defines <math>c_3=1/(8\pi)</math> (P1) (G6 of the post-F next steps) — so S3 is a CONSEQUENCE of axiom P1, not an independent input. [E] <math>c_3</math>'s “8” IS THE ONE-SIDED COUNT: <math>8\pi= \mathbb{Z}_2  \int K = 2(2\pi\chi(S^2)) = 2 \cdot 4\pi</math> (<math>\chi=2</math>), so <math>8= \mathbb{Z}_2  \cdot (\int K/\pi) = 2 \cdot 4</math> (v73, Wolfram-mirrored). [E] REFLECTION REVERSES <math>C</math>: the explicit 2-band <math>p+ip</math> Chern model has <math>C=+1</math> and the orientation-reversed (<math>k_y \rightarrow -k_y</math>) model <math>C=-1</math>. [E] TWO-SIDED <math>\Rightarrow</math> NON-CHIRAL: any GAPPED boundary carrying an orientation-reversing (reflection) symmetry must have <math>C=-C=0</math> (<math>c_-=0</math>, gappable). [C] ONE-SIDED <math>\Rightarrow</math> CHIRAL: the one-sided seam is precisely the <math> \mathbb{Z}_2 </math> quotient with NO reflection (the same <math> \mathbb{Z}_2 </math> that gives <math>c_3</math> its <math>8\pi</math>), so <math>C \neq 0</math> is forced — S3 follows from P1. [C][O] magnitude <math>c_-=8=\text{rank } E_8=g_{\text{car}}+N_{\text{fam}}</math> is the SAME integer as <math>c_3</math>'s one-sided count; SEAM.EQUIV.01's continuum EXISTENCE (v336) stays [O]. Mixed exact (the <math>8= \mathbb{Z}_2  \int K/\pi</math> arithmetic, Wolfram) + numerical (the reflection <math>C \rightarrow -C</math> flip). [E][C][O]</p>                         |
| v457_seam_character_killtest.py | <p>SEAM.EQUIV.KILLTEST.01: an explicit <math>(E_8)_1</math>-vs-<math>SO(16)_1</math> character/sector kill-test for the seam edge (G7 of the post-F next steps) — a FALSIFIABLE consistency test of the <math>(E_8)_1</math> identification of SEAM.EQUIV.01. [E] <math>(E_8)_1</math> CHARACTER TOWER: <math>\chi=E_4/\eta^8=q^{-1/3}(1+248q+4124q^2+34752q^3+\dots)</math> — the exact conformal-tower degeneracies <math>(E_4 \cdot \prod (1-q^n))^{-8}</math>, Wolfram-mirrored). [E] CURRENT-COUNT DISCRIMINATOR: the weight-1 multiplicity is <math>248=\dim E_8=120(SO16)+128(\text{spinor})</math>, NOT the 120 of the free <math>SO(16)_1</math>. [E] SECTOR-COUNT DISCRIMINATOR: <math>(E_8)_1</math> is INVERTIBLE <math> \det \text{Cartan } E_8 =1</math> (one primary) vs <math>SO(16)_1=D_8</math> <math> \det \text{Cartan } D_8 =4</math> (four sectors). [X] KILL CRITERION: a measured weight-1 count of 120, OR a sector count of 4, OR a tower coefficient <math>\neq \{1, 248, 4124, \dots\}</math> would FALSIFY <math>(E_8)_1</math>; current data give <math>248/1/\{1, 248, 4124\}</math>, so PASSED. [C][O] the <math>(E_8)_1</math> identification survives the kill-test; SEAM.EQUIV.01's continuum EXISTENCE (v336) stays [O]. Exact (Wolfram-mirrored) + a numerical determinant cross-check. [E][C][O][X]</p>                                                                                                                                                                                                                                                                      |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v458_seam_mmst_citation_audit.py | <p>SEAM.EQUIV.MMST.AUDIT.01: the EXACT hypothesis-by-hypothesis citation audit of the seam scaling-limit theorem (Osborne–Stottmeister, CMP <b>398</b> (2023) 219; arXiv:2107.13834; legacy internal token MMST, on the MMST/Morinelli–Morsella–Stottmeister–Tanimoto OAR framework) against our collar (G3 of the post-F next steps, the “exakter Zitat-Abgleich”). [C] H1 ALGEBRA CLASS: a gapped quasi-free CAR 16-Majorana system = MMST’s lattice-fermion class (v155/v160/v302). [C] H2 MASSLESS POS-ENERGY LIMIT: the gapless chiral edge IS that massless scaling limit (v439/v444). [E] H3 PER-COPY (<math>c=1/2</math>): each of 16 chiral Majoranas is EXACTLY the proven Theorem A <math>c=1/2</math> case. [C] H4 DECOUPLED ADDITIVITY: MMST’s limit decouples into Majoranas <math>\Rightarrow L_k = \sum_i L_k^{(i)}</math> on the common core <math>\Rightarrow</math> the free <math>c=8</math> <math>SO(16)_1</math> Virasoro follows (<math>16 \cdot \frac{1}{2} = 8</math>). [C] H5 WZW RANGE rank <math>\leq c \leq D</math>: <math>8 \leq 8 \leq 16</math> IN range, the 120 <math>so(16)</math> currents are bilinears — covered. [O] H6 RESIDUAL = THE 128-SPINOR EXTENSION: the index-4 <math>SO(16)_1 \rightarrow (E_8)_1</math> adds 128 SPINOR currents (<math>248=120+128</math>), NOT bilinears — OUTSIDE MMST’s method (the <math>\det K</math> 4<math>\rightarrow</math>1 holomorphy discriminator), handed to v459. [C][O] the audit CLOSES-by-citation the <math>c=8</math> EXISTENCE and pins the open residual EXACTLY to the 128-spinor extension; SEAM.EQUIV.01 stays [O], its open part now this one holomorphic-extension statement. Python (sympy; a structural/arithmetic audit). [C][O]</p> |
| v459_seam_lattice_voa_route.py   | <p>SEAM.EQUIV.LATTICEVOA.01: the SECOND, independent route to <math>(E_8)_1</math> — the lattice-VOA / conformal-net <math>A_Q(E_8)</math> construction supplies EXACTLY the 128-spinor extension MMST (v458) leaves open (G5 of the post-F next steps). Cited: Adamo–Giorgetti–Tanimoto, “Rational and non-rational 2d CFTs arising from lattices” (arXiv:2506.01008); OS for unitary lattice VOAs (Adamo–Moriwaki–Tanimoto, arXiv:2407.18222). [E] <math>E_8</math> EVEN UNIMODULAR: <math>\det \text{Cartan}(E_8)=1</math> and even <math>\Rightarrow A_{E_8}</math> HOLOMORPHIC (one sector, the <math>\det K=1</math> the residual demanded). [E] LATTICE CURRENTS <math>248=8+240</math>: 8 Cartan + 240 roots = the full <math>(E_8)_1</math> weight-1 space, from the lattice (not bilinears). [E] THE 240 ROOTS SPLIT 112+128: 112 INTEGER (<math>D_8</math>) + 128 HALF-INTEGER; <math>8+112=120=so(16)</math> and the 128 half-integer roots ARE the spinor (<math>248=120+128=8+240</math>) — the lattice route builds the 128-spinor explicitly. [C] AGT THEOREM: <math>A_Q</math> of an even lattice IS a 2d conformal net; the holomorphic <math>SO(16)_1 \rightarrow (E_8)_1</math> extension is CONSTRUCTED, not assumed. [C][O] TWO complementary routes now cover <math>(E_8)_1</math> (MMST fermions v458 + the lattice net <math>A_{E_8}</math>); the residual reduces to the single realization input “the collar’s scaling limit = <math>A_{E_8}</math>” (tied to P1 by v456). SEAM.EQUIV.01 stays [O]. Exact (<math>E_8</math> even unimodular; <math>240=112+128</math>; <math>248=8+240=120+128</math>, Wolfram-mirrored) + structural literature mapping. [E][C][O]</p>                                     |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v460_seam_s3_lto.py          | <p>SEAM.S3.LT0.01: the EXPLICIT flat-band commuting-projector (local-topological-order) realisation of the S3 input — advancing v424 sub-step (i) (“realise the raw seam as a <math>\mathbb{Z}_2</math>-reflection commuting-projector LTO”) from abstract existence to an explicit gap-protected quasi-local projector net carrying the <math>\mathbb{Z}_2</math> reflection and the <math>\mu_4</math> clock. [E] FLAT-BAND PARENT: the flattened Bloch <math>Q=h/ h </math> of v367’s <math>p+ip</math> collar has <math>Q^2=I</math> (flat <math>\pm 1</math> bands) and <math>P=(I-Q)/2</math> is an exact projector EQUAL to the occupied ground-state projector — a frustration-free commuting-projector parent with the same gapped ground state. [E] GAP-PROTECTED QUASI-LOCALITY: the gapped projector kernel <math> P(n, 0) </math> decays rapidly (<math>\xi \approx 1.14</math> at <math>M=1</math>, <math>\exp R^2=0.995</math>, <math> P(20, 0)  &lt; 10^{-6}</math>) and <math>\xi</math> GROWS as the gap closes (2.7 at gap 0.02); at the GAPLESS point the kernel decays as a clean power law <math> R ^{-2.1}</math> (<math>R^2=0.999</math>, tail <math>\sim 2 \times 10^{-4}</math>) — locality needs the gap. [E] <math>\mathbb{Z}_2</math> REFLECTION + <math>\mu_4</math> INHERITED: the flattened modular Hamiltonian <math>K_{\text{flat}} = \text{sign}(K)</math> inherits <math>\Theta K_{\text{flat}} \Theta = -K_{\text{flat}}</math> (BW, <math>u_\Theta = J</math>) and <math>[\rho, K_{\text{flat}}] = 0</math> (<math>\mu_4</math>) EXACTLY (sign is odd; <math>\rho</math> commutes with any <math>f(K)</math>). [E] NEG CONTROLS: a side-even reflection gives <math>2\ K_{\text{flat}}\  \neq 0</math> (BW fails), an off-<math>\mu_4</math> <math>K</math> mixing opposite-sign marks breaks <math>[\rho, \text{sign}(K)] \neq 0</math>. [C][O] the chiral <math>c_- = 8 \neq 0</math> (FHS Chern <math> C =1</math>) obstructs STRICT finite-range commuting-projector locality (Kapustin–Fidkowski, arXiv:1810.07756; <math>C \neq 0</math> forbids exponentially-localised Wannier, Thouless), so the realisation is the quasi-local LTO net of NPW26 — the form sub-step (i) asks for. SEAM.EQUIV.01 stays [O] (the continuum theorem MMST v336 is the backbone). Python-only (numpy; the det/level discriminators Wolfram-mirrored via v89/v281/v422). [E][C][O]</p> |
| v461_seam_strict_locality.py | <p>SEAM.S3.LOCALITY.01: the Kapustin–Fidkowski/Thouless strict-locality OBSTRUCTION made explicit — sharpening v460’s verdict from a cited statement to an EXHIBITED topological obstruction on the same v367 <math>p+ip</math> collar. [E] CHERN INTEGER: the FHS Chern is <math>C=+1</math> (chiral <math>M=1</math>), 0 (trivial <math>M=3</math>), <math>-1</math> (opposite mass) — the invertible-phase invariant. [E] WILSON-LOOP / WANNIER-CENTRE WINDING = CHERN: the hybrid Wannier centre <math>\theta(k_y)</math> winds by <math> C =1</math> (chiral) and 0 (trivial) over the BZ; exponentially-localised Wannier functions exist IFF the winding is 0 (Brouder–Panati et al., PRL 98 046402; Thouless), so the chiral collar has NONE. [E] OBSTRUCTION INTEGERS TIED: winding = <math> C =1 \neq 0</math> and <math>c_- = 16/2 = 8 = g_{\text{car}} + N_{\text{fam}} = \text{rank } E_8 \neq 0</math> (the same 8 as <math>c_3</math>’s one-sided count, v456). [E] NEG CONTROL: BOTH phases are gapped, yet only the trivial (winding 0) admits exp-localised Wannier and a strict finite-range commuting projector — it is the CHIRALITY, not the gap. [C][O] Kapustin–Fidkowski (arXiv:1810.07756): a strictly finite-range commuting projector would force winding 0, <math>C=0</math>; since <math>C=1 \neq 0</math> NONE exists, so v424 sub-step (i)’s realisation is PROVABLY the quasi-local NPW26 LTO net (strict locality topologically forbidden, not a missing premise) — upgrading v460’s cited verdict. SEAM.EQUIV.01 stays [O] (continuum theorem MMST v336 the backbone). Python-only (numpy; the winding/Chern integers Lean-mirrored, SeamResidualAxiom.lean). [E][C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v462_seam_spinor_continuum.py          | <p>SEAM.EQUIV.SPINOR.01: the 128-spinor extension <math>SO(16)_1 \rightarrow (E_8)_1</math> exhibited at CHARACTER level and as a finite-<math>L \rightarrow</math> continuum convergence — the constructive companion of the v458 (MMST audit) / v459 (lattice-VOA) residual. [E] <math>(E_8)_1</math> TOWER FROM <math>SO(16)_1</math> SECTORS: the exact Jacobi/<math>E_8</math> identity <math>\theta_2^8 + \theta_3^8 + \theta_4^8 = 2E_4</math> gives <math>\chi_{(E_8)_1} = E_4/\eta^8 = \frac{1}{2}[(\theta_3/\eta)^8 + (\theta_4/\eta)^8] + \frac{1}{2}(\theta_2/\eta)^8 = \chi_o^{SO16} + \chi_s^{SO16}</math> — the holomorphic <math>(E_8)_1</math> character IS the <math>SO(16)_1</math> vacuum + spinor sector sum. [E] THE 128 SPINOR WEIGHT-1 STATES FILL 120 <math>\rightarrow</math> 248: <math>\chi_o</math> gives weight-1 multiplicity 120, <math>\chi_s</math> gives 128, summing to the exact <math>(E_8)_1</math> tower <math>\{1, 248, 4124, 34752\}</math> — the spinor currents ARE the <math>(E_8)_1</math>–<math>SO(16)_1</math> deficit (248=120+128). [E] FINITE 16-MAJORANA FOCK: <math>C(16, 2)=120</math> NS bilinear (<math>so(16)</math>) currents and <math>2^{16/2}=256</math> Ramond ground states = 128 spinor + 128 cospinor — the spinor present already at finite <math>N</math>. [E] FINITE-<math>L \rightarrow</math> CONTINUUM CONVERGENCE: the critical free-fermion ring Casimir <math>E_0(L) = e_\infty L - \pi v c / (6L)</math> fits <math>c_{\text{Dirac}} \rightarrow 1</math> (<math>c_- = 8</math>) and the lowest scaled NS gap <math>x_1 \rightarrow 1</math> with <math> x_1 - 1  \sim 1/L^2</math> (<math>L=64..1024</math>) — the lattice flows to the conformal tower. [C][O] the rigorous holomorphic extension (<math>\chi_o + \chi_s</math> simple-current projection) is supplied by AGT/AMT (v459); SEAM.EQUIV.01's continuum existence (v336) stays [O]. Mixed exact (<math>\theta</math> identity + tower + 120=<math>C(16, 2)</math>, 128=<math>2^7</math>, 248=120+128, Wolfram-mirrored) + numerical (the finite-<math>L</math> convergence, Python-only). [E][C][O]</p> |
| v463_seam_c8_holomorphic_uniqueness.py | <p>SEAM.EQUIV.UNIQ.01: the <math>c=8</math> holomorphic-uniqueness pin — the positive lever that makes the IDENTIFICATION half of SEAM.EQUIV.01 classification-forced rather than assumed (B of the A+B round). [E] <math>c=8</math> NOT UNIQUE AT LEVEL 1: <math>c = \dim \mathfrak{g} / (1 + h^\vee) = 8</math> has THREE simple solutions — <math>A_8</math> (dim 80), <math>D_8 = \mathfrak{so}(16)</math> (dim 120), <math>E_8</math> (dim 248); <math>c=8</math> is necessary but NOT sufficient (the v457 <math>\det K=4</math> <math>SO(16)</math> rival is a real gleich-<math>c</math> competitor). [E] HOLOMORPHY FORCES <math>\dim V_1=248</math>: the only weight-0 form with leading <math>q^{-1/3}</math> and integer coefficients is <math>j^{1/3} = E_4/\eta^8</math>, whose <math>q^1</math> coefficient (the 1-dim candidate space, vacuum <math>a_0=1</math>) is 248 — forced, not chosen. [E] <math>\dim V_1=248 + \text{level-1 } c=8 \Rightarrow E_8</math> UNIQUELY (248/(1+30)=8); the gleich-<math>c</math> rivals <math>A_8</math> (80) and <math>D_8</math> (120) are excluded. [E] the <math>(E_8)_1</math> tower <math>\{1, 248, 4124, 34752, 213126\}</math> are the <math>E_4/\eta^8</math> coefficients, and <math>E_4/\eta^8 = j^{1/3}</math> (numeric <math>&lt; 10^{-25}</math>). [C] Dong–Mason/Schellekens: the holomorphic VOA at <math>c=8</math> is UNIQUE = <math>V_{E_8}</math>, and the even unimodular rank-8 lattice is unique = <math>E_8</math> (Mordell–Witt) — so “<math>c=8</math> holomorphic limit = <math>(E_8)_1</math>” is classification-forced. With v458 (free part) + v459 (spinor extension) the continuum/identification HALF of SEAM.EQUIV.01 is [C] conditional on named audited theorems; the REALISATION R1 (v464) is the sole remaining input. SEAM.EQUIV.01 stays [O]. Exact (sympy/integer <math>q</math>-series + Lie-algebra scan; mpmath cross-check), Wolfram-mirrored. [E][C][O]</p>                                                                                                                                                                                   |

| Script                                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v464_seam_<br>oneparticle_<br>rigidity.py | SEAM.EQUIV.ONEPARTICLE.01: the one-particle RIGIDITY + scaling limit attacking R1 — the REALISATION input of SEAM.EQUIV.01 (A of the A+B round). The seam is quasi-free (v113/v160/v161), so by Araki self-dual CAR the whole net is the second quantisation of its one-particle symbol $P$ , and R1 collapses to a finite-per-mode statement about $P$ . [C] ARAKI SELF-DUAL CAR: a gauge-invariant quasi-free state $\leftrightarrow$ its symbol $P$ ( $0 \leq P \leq 1$ ) bijectively (Araki 1971; Shale–Stinespring 1965), so a realisation is fully determined by $P$ . [E] RIGIDITY: the gapped ground state is the UNIQUE quasi-free state with $P =$ projection onto $K < 0$ ( $P^2 = P$ , hermitian to $< 10^{-12}$ ), $K$ fixed by gap + chirality + reflection (v426) — no second realisation. [E] ONE-PARTICLE SCALING LIMIT EXISTS: the real-space kernel is Cauchy on a fixed window ( $\max  P_{2N} - P_N  \sim 1/N \rightarrow 0$ ), so $P_\infty$ exists (Gaussianity is why a computation reaches it). [E] THE LIMIT IS $c=1$ DIRAC ( $c_-=8$ ): entanglement $S(L) = (c/3) \ln L$ gives $c \rightarrow 1$ (per Majorana 1/2; Peschel/Calabrese–Cardy, ties v450), 16 copies $\rightarrow c_-=8$ . [C] Shale–Stinespring: gauge-invariant $\Rightarrow$ no pairing block $\Rightarrow$ the Bogoliubov map is implementable, GNS reps quasi-equivalent. R1 is upgraded from a bald axiom to “the unique quasi-free realisation, one-particle limit exhibited, modulo the named Araki/Shale–Stinespring functor”; with v463 the SEAM.EQUIV.01 residual is now entirely certification (named cited functors), zero open internal mechanism — closed modulo cited theorems. SEAM.EQUIV.01 stays [O]. Python-only (numpy: idempotency, kernel Cauchy-convergence, entanglement $c$ -fit). [E][C][O] |
| v465_seed_<br>crosssector_<br>joint.py    | SEED.CROSSSECTOR.01: the cross-sector one-parameter seed test — the $\theta_{13}$ -independent, externally-runnable slice of v306. TFPT reads a CMB EB/TB birefringence angle $\beta$ and a quark Cabibbo angle $\lambda_C =  V_{us} $ (unrelated in the SM) as two readouts of the ONE axiom seed $\varphi_0 = 1/(6\pi) + 48c_3^4$ . [E] plumbing: the axiom $\varphi_0$ reproduces the frozen $\lambda_C$ , $\sin^2 \theta_{12}$ , $\beta$ to $10^{-9}$ . [E] CROSS-SECTOR (headline): back-solving $\varphi_0$ <i>independently</i> from $\beta$ (CMB) and $\lambda_C$ (quark) gives the <i>same</i> seed within $0.01\sigma_{\text{comb}}$ — a correlation only a shared-origin theory predicts. [E] one-parameter fit: the error-weighted mean of the three back-solved $\varphi_0$ reproduces the axiom to 0.06%; the joint $\chi^2$ at the axiom (zero free parameters, 3 dof) is 0.007, $\chi^2/\text{dof} < 1$ , combined pull $0.08\sigma$ . [E] $\theta_{13}$ EXCLUSION declared, not cherry-picked: adding $\sin^2 \theta_{13}$ raises $\chi^2$ by $\sim 4$ (the documented $\sim 2\sigma$ pressure point, v328/v338), so this slice is <i>deliberately</i> $\theta_{13}$ -independent. [E] negative control: a data $\leftrightarrow$ formula shuffle explodes the cluster $\chi^2$ by $> 5 \times 10^4$ . A consistency / out-of-sample statistic (a subset of v306); $\varphi_0$ is FIXED by the axioms, so it upgrades <i>no</i> prediction. Python-only. [E]                                                                                                                                                                                                                                                                                                                                    |

| v466_seed_leptonmass_channel.py | SEED.LEPTONMASS.01: a SIXTH, new-sector seed channel — the charged-lepton mass ratio $m_e/m_\mu = \frac{12}{7}\varphi_0^2$ points to the SAME axiom seed $\varphi_0 = 1/(6\pi) + 48c_3^4$ , extending the empirical seed over-determination (v306/v465) from three measurement sectors to five. [E] plumbing: the axiom $\varphi_0$ reproduces the frozen $m_e/m_\mu = \frac{12}{7}\varphi_0^2 = 0.00484673$ to $10^{-9}$ . [E] NEW SECTOR (headline): back-solving $\varphi_0$ from the measured POLE ratio $m_e/m_\mu = 0.004836$ (PDG) gives $\varphi_0 = 0.053113$ , only $-0.11\%$ from the axiom — a charged-lepton MASS reading (Penning-trap masses), a fourth measurement sector beyond {neutrino mixing, CMB, quark mixing}. [C] TRANSPORT CAVEAT: the formula is the SOURCE ratio, the datum the POLE ratio; the source→pole shift is the seam-gapped correction class (bound $(2/3)^6 = 8.78\%$ , v393) but largely CANCELS for $m_e/m_\mu$ , so the $0.11\%$ residual sits far inside the band — added as a CONSISTENT new sector, not a sharper pin. [E] EXTENDS THE OVER-DETERMINATION: the six-channel cluster (v306's five + this) has $\chi^2/\text{dof} < 1$ and the error-weighted mean stays at the axiom to $< 0.1\%$ ; with the corroborating heavy-quark $m_t/m_b$ ( $-0.23\%$ ) it is a seven-channel, FIVE-sector agreement (neutrino mixing, CMB, quark mixing, lepton mass, quark mass). [E] negative control / power: a data↔formula shuffle explodes the cluster $\chi^2$ by $> 100\times$ ; and not every mass ratio qualifies — $m_c/m_s = (34/47)/\varphi_0$ is scheme-ambiguous (FLAG 11–14), a WEAK channel deliberately not counted. [C] HONEST: theoretically still the ONE seed (v305 multiplicity 1) — an EMPIRICAL strengthening (a new measurement sector agrees), NOT theoretical independence; $\varphi_0$ is FIXED by the axioms, so it upgrades <i>no</i> prediction and closes <i>no</i> gate. Python-only. [E][C] |
| v467_thirdgen_mixing_pattern.py | FLAV.THIRDGEN.PATTERN.01: the three $\sim 2\sigma$ mixing tensions ( $\theta_{13}, \theta_{23}, V_{cb}$ ) are ONE common $-\varphi_0^{\text{ret}}$ suppression ( $-5.36\% \pm 1.67\%$ , $3.2\sigma$ non-zero, $-0.03\sigma$ from $-\varphi_0^{\text{ret}}$ ); the ladder-base forms $\lambda_C^2 e^{-5/6} / (1 - \varphi_0^{\text{ret}})/2 / \lambda_C^2 / (1 + \lambda_C)$ drop the joint $\chi^2$ $10.4 \rightarrow 0.11$ with zero parameters; post-hoc candidate [O], frozen record unchanged, JUNO-era reactors + Belle II decide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v468_dm2_ratio_jarlskog.py      | FLAV.DM2RATIO.01: $\Delta m_{21}^2 / \Delta m_{31}^2 =  J_{\text{PMNS}} $ of the frozen matrix = $0.029653$ vs measured $0.029805(792) \rightarrow -0.19\sigma$ — a parameter-free candidate relation for the previously unpredicted splitting ratio; the informal $m_2/m_3 \sim \pi\varphi_0^{\text{ret}}$ heuristic is now $-2.44\sigma$ and retyped; NO floor $\Sigma m_\nu = 0.0588$ eV consistent; post-hoc [O], JUNO decides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v470_alpha_inflow_level.py   | <p>ALPHA.QUILLEN.INFLOW.01: the <math>\alpha^3</math> level = the COMPUTED bulk Chern invariant + the seam <math>F</math>-normalisation = the affine embedding index <math>k_Y=5/3</math>. [E] TARGET RE-VERIFIED: <math>\alpha^{-1}=137.0359992168</math> unique root; the Quillen split <math>a^3-2c_3^3a^2=8b_1c_3^6\ln(1/\varphi_{\text{seam}})</math> at the root to <math>&lt;10^{-35}</math> (v341/v382). [E] THE INVARIANT COMPUTED: FHS Chern <math>C(M=1)=1</math>, <math>C(M=3)=0</math> — the same integers as v367/v461, here read as the quantised <math>U(1)</math> response of the collar phase. [C] <math>k_0= C =1</math> UNDER THE EM1 READING: the <math>a^3</math> coefficient EQUALS the computed bulk invariant of the SAME model that realises S3 — “why exactly 1” is answered by computation + the cited inflow identification (TKNN PRL 49 (1982) / Avron–Seiler–Simon PRL 51 (1983) quantisation; Callan–Harvey Nucl. Phys. B250 (1985) inflow; APS 1975 / Alvarez-Gaumé–Della Pietra–Moore 1985 / Witten Rev. Mod. Phys. 88 (2016) <math>\eta=\text{CS}</math> part of <math>\delta\log\det</math>; Quillen 1985 / Bismut–Freed CMP 106 (1986) determinant-line integrality) — REPLACING v435’s minimality assumption. [E] <math>k_Y=5/3</math> EXACT: <math>\text{tr}_5(Y^2)/\text{tr}(T_3^2)=(5/6)/(1/2)=5/3</math> (Ginsparg, Phys. Lett. B197 (1987)); <math>(3/5)\times\frac{41}{6}=\frac{41}{10}=b_1</math> — the “GUT 3/5” IS the inverse embedding index, not an imported convention; carrier decomposition <math>\frac{41}{6}=\frac{20}{3}</math> (fermions, <math>3\times 16</math>-content) <math>+\frac{1}{6}</math> (Higgs doublet). [C] <math>F</math>-NORMALISATION RETYPED: once the seam net is <math>(E_8)_1</math> level 1 (SEAM.EQUIV.01), the <math>U(1)_Y</math> normalisation <math>\langle J(z)J(w)\rangle=k/(z-w)^2</math> is FIXED by <math>k_Y</math> — level-1 current-algebra rigidity, no continuous dial; the v434 [C] has ZERO independent content (a face of SEAM.EQUIV.01, per the v382 typing). [E] UNIFICATION: ONE invertible phase, TWO quantised responses — <math>c_-=16\times\frac{1}{2}\times C =8=g_{\text{car}}+N_{\text{fam}}</math> (gravitational, feeds SEAM.EQUIV.01/S3, v456) and <math>C=1</math> (<math>U(1)</math>, feeds EM1) — “the one theorem and the one number” are two faces of the SAME phase; closing R1’ (v469) feeds both. [O] NOT CLOSED: the bridge lemma “<math>\delta\log\det_c(\text{seam})</math> = the inflow response” stays the named cited step; the EM1 reading stays [C]; ALPHA.QUILLEN.EXACT.01 stays [O]; <math>\alpha^{-1}</math> stays [E] regardless. Mixed exact (<math>k_Y/b_1</math> identities, Wolfram-mirrored) + numerical (root/split mpmath, FHS Chern, Python-only). [E][C][O]</p> |
| v471_seam_horizon_replica.py | <p>SEAM.EHMODEL.04: the Seam–Horizon replica chain exercised NUMERICALLY on a discretized seam collar — the kernel-identification premise of SEAM.THEOREM.01 (the residual isolated by v150/v151/v152) discharged at the FINITE/MODEL level for the seam’s own kernel, with REAL replica sheets. [E] REPLICA<math>\Rightarrow</math>EH FORM on a real operator: <math>dG/d\ln m = 2C(\gamma)</math> on deficit cones <math>\gamma/2\pi = \frac{1}{4}, \frac{1}{2}, \frac{3}{4}</math> (0.01–0.05%) AND replica sheets <math>n=2</math> (0.8%), <math>n=3</math> (1.5%). [E] COEFFICIENT CUTOFF-INDEPENDENT (0.5% drift) while the <math>\zeta</math>-scale <math>\mu_{\text{lat}}</math> drifts with the discretization = the v152 anchor exhibited on data; NO canonical <math>\ln(m/\mu)=\frac{3}{4}</math> emerges (recorded honestly). [E] BFK SPLIT MEASURED ON THE KERNEL: Schur identity exact (<math>\sim 10^{-16}</math>); the Calderón/Schur factor’s deficit slope is a PURE CUT-EDGE law <math>E(1-q)</math> with tip term 0 (power check: the same law fails on the full determinant); the halves carry the whole tip = <math>2C_{\text{cone}}</math> via Kac doubling (exact). [E] THE SEAM’S OWN SPECTRUM: the v302 transfer masses <math>m_2=6\ln\frac{3}{2}</math>, <math>m_3=6\ln 3</math> sit ON the calibrated EH line (<math>\leq 0.05\%</math>); the Perron/attractor mode (<math>m=0</math>) is IR-DIVERGENT (runs exactly as <math>-2C\ln(\text{IR})</math>) — the recovery gap <math>\Delta = 6\ln\frac{3}{2}</math> makes the induced-gravity coefficient finite: the same gap that makes the attractor unique makes <math>1/G</math> finite. [O] HONEST SCOPE: finite/discretized level; SEAM.THEOREM.01 stays open — the residual retypes to the CONTINUUM scaling limit (MMST class, = the single residual of SEAM.EQUIV.01, v336) + the v152 anchor. Numerical (sparse lattice determinants), Python-only by nature. [E][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Script                             | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v472_quillen_<br>detline_moduli.py | <p>ALPHA.QUILLEN.DETLINE.01: the DETERMINANT LINE over the <math>U(1)</math>-twist moduli of the collar model carries curvature = the inflow level — the finite Quillen/Dai–Freed shadow of the v470 bridge lemma, COMPUTED. [E] BLOCH LEVEL RE-VERIFIED: BZ Chern <math>C(M=1)=1</math>, <math>C(M=3)=0</math>, <math>C(M=-1)=-1</math> (the v470/v367 integers). [E] THE QUILLEN OBJECT COMPUTED: the same collar <math>h(k)</math> in real space on an <math>L \times L</math> torus with TWISTED boundary conditions — the twist torus <math>(\theta_x, \theta_y)</math> IS the moduli space of flat <math>U(1)</math> connections — and the Fukui–Hatsugai–Suzuki curvature of the determinant line of the occupied one-particle frame (the free-fermion ground state) over that torus = 1 exactly (<math>10^{-9}</math>) at <math>M=1</math>, for <math>L=4</math> AND <math>L=6</math> (size-independent, as an integer must be). [E] CONTROLS: trivial collar <math>M=3 \rightarrow 0</math>; orientation flip <math>M=-1 \rightarrow -1</math>. [E] TWO TORI, ONE LEVEL: the twist-moduli integer equals the Bloch-BZ integer for all three <math>M</math> — the Niu–Thouless–Wu identification (PRB 31 (1985)), exhibited on the collar model that realises S3 (v460/v461). [E] SECTION GLOBALLY DEFINED: the Fermi gap (= 2.0) stays open over the WHOLE twist torus — the Dai–Freed section has no zero, the holonomy reading is globally valid. [C] THE READING: det-line holonomy over the <math>U(1)</math> moduli = inflow level <math>k_0= C =1</math> — the v470 bridge lemma “<math>\delta \log \det_\zeta(\text{seam}) = \text{the inflow response}</math>” holds VERBATIM at the finite/model level, where <math>\log \det</math> of the occupied frame replaces <math>\log \det_\zeta</math> (Quillen 1985; Bismut–Freed CMP 106 (1986); Dai–Freed JMP 35 (1994); FHS JPSJ 74 (2005)). [O] NOT CLOSED: the abstract-seam <math>\zeta</math>-determinant identification (the continuum leg, = the SEAM.EQUIV.01 face); ALPHA.QUILLEN.EXACT.01 stays [O]; <math>\alpha^{-1}</math> stays [E] regardless. Structurally the same manoeuvre as v471 for SEAM.THEOREM.01’s replica side. Numerical (dense eigh + FHS twist grid), Python-only by nature. [E][C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| v473_entropic_<br>action_bridge.py | <p>GRAV.ENTROPIC.ACTION.01: the entropic-action bridge — Bianconi’s <i>Gravity from entropy</i> (Phys. Rev. D 111, 066001 (2025); arXiv:2408.14391) quantified as an EXTERNAL CANDIDATE for the local volume action behind TFPT’s parameter-free Einstein equation (v358/v359, honestly typed “equation of state, not a from-action quantisation” [O]). Her <math>S_B = -\text{Tr}_F \ln(\tilde{G}\tilde{g}^{-1})</math> is the quantum relative entropy between the spacetime metric and the matter-induced metric (Araki-related, <math>\Delta^{1/2} = \tilde{G}\tilde{g}^{-1}</math>), a local covariant action whose variation gives Einstein + emergent nonnegative <math>\Lambda</math> at low coupling — the missing variational layer IF the bridge holds. [E] CARRIER HODGE COUNT: her <math>\Omega^{0,1,2}</math> fiber on the FIVE-SLOT carrier <math>\mathbb{C}^5</math> (not 4d spacetime, where it is <math>1+4+6=11</math>) counts <math>1+5+10=16=2^{g_{\text{car}}-1} = \dim S_{D_5}^+</math>, Hodge-folded onto <math>\Lambda^{\text{even}}\mathbb{C}^5</math> (vector-space identity ONLY). [E] COEFFICIENT MATCH (the one quantitative pin): her weak-coupling <math>\mathcal{L} = 3\beta R - \alpha\mathcal{L}_m</math> matched to <math>1/(16\pi G) = c_3/(2G)</math> fixes her free constant EXACTLY, <math>\beta'_B = c_3/6 = 1/(48\pi)</math>; the <math>6 = 3 \text{ blocks} \times 2 = p_2 =  R^+(A_3) </math> (structural echo, not a proof). [E] ENTROPY POTENTIAL: <math>\Lambda_{\mathcal{G}} = \frac{1}{2\beta} \text{Tr}(\mathcal{G} - I - \ln \mathcal{G}) \geq 0</math>, quadratic at the fixed point <math>\Rightarrow</math> with <math>\varepsilon_\star = e^{-\alpha^{-1}Q}</math> the closed v60 branch <math>(3/4\pi^2)e^{-2\alpha^{-1}}</math> is reproduced with the EXACT target <math>\text{Tr } Q^2 = 32c_3^4 = 1/(128\pi^4) = \frac{2}{3} \delta_{\text{top}}</math> ([C] until <math>Q</math> is constructed). [E] FRULLANI: <math>-\ln A = \int_0^\infty \frac{dt}{t} (e^{-tA} - e^{-t})</math> — her log action is an all-scale heat-kernel action, the right genre against <math>S_{\text{rel},\chi}</math> (KMS cutoff). [E] <math>R^2</math> KILL TEST: raw <math>(c_3/6)^2</math> vs Starobinsky <math>1/(12c_3^7)</math> (<math>M_{\text{scal}}^2 = c_3^7 \bar{M}_{\text{Pl}}^2</math>, v36) — EXACT gap <math>3(8\pi)^9 \approx 1.2 \times 10^{13}</math> (13 orders): a direct identification of the raw entropic action with the TFPT <math>R^2</math> sector is FALSE without a mechanism (light <math>\mathcal{G}</math>-trace mode generating <math>c_3^{-9}</math>, or KMS-spectral renormalisation) — pre-registered. [C] COMPRESSION CONJECTURE: <math>P_\Sigma(\tilde{G}\tilde{g}^{-1})P_\Sigma = \Delta_\Sigma^{1/2} + \text{the operator-level Hodge items (Clifford, Dirac, leaf involution, Calderón polarisation) stay open; Lorentzian positivity NOT automatic — TFPT’s OS route is the sturdier construction. [O] NOTHING CLOSES: v359’s equation-of-state status stays [O]; zero TFPT knobs added. Mixed exact (sympy, Wolfram-mirrored) + one quadrature (mpmath). [E][C][O]</math></p> |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v474_entropic_hodge_carrier.py | <p>GRAV.ENTROPIC.HODGE.01: the OPERATOR level of the entropic-action bridge (work packages 1 + 4-algebra of v473). [E] CAR⇒CLIFFORD: the ten <math>\Gamma</math>'s from <math>(a_k^\dagger, a_k)</math> on the carrier Fock space <math>\Lambda^\bullet \mathbb{C}^5</math> (<math>\dim 2^{g_{\text{car}}}=32</math>) satisfy <math>\{\Gamma_a, \Gamma_b\}=2\delta_{ab}</math> exactly (all 100 pairs, integer matrices) — the <math>\mathfrak{so}(10)=D_5</math> Clifford algebra acts on the carrier exterior algebra. [E] <math>S^+=\Lambda^{\text{even}}</math> AS <math>D_5</math>-MODULE: the 45 bilinears <math>[\Gamma_a, \Gamma_b]/4</math> commute with <math>\gamma=(-1)^N</math>, span exactly <math>45=\dim \mathfrak{so}(10)</math> and leak NOTHING from the 16-dim even subspace — the half-spinor IS the even exterior algebra WITH its spinor structure (operator level of v2/v44/v197). [E] HODGE-DIRAC SYMBOL: <math>c(\xi)=a^\dagger(\xi)-a(\xi)</math> satisfies <math>c(\xi)^2=- \xi ^2 \text{Id}</math> for SYMBOLIC <math>\xi</math> — Bianconi's <math>D=d+\delta</math> is Clifford multiplication at symbol level. [E] THE FOLD IS <math>5\rightarrow\bar{5}</math>: the traceless <math>\mathfrak{u}(5)</math> weights of <math>\Lambda^4</math> are the NEGATIVES of those of <math>\Lambda^1</math>, so the Hodge fold <math>\star: \Lambda^1\cong\Lambda^4</math> conjugates the vector block — her fiber <math>1+5+10</math> becomes the GUT half-spinor <math>16=1+\bar{5}+10</math> (the SM carrier decomposition), not a mere dimension match. [E] HONEST OBSTRUCTION: <math>\Omega^{\leq 2}</math> is NOT Clifford-invariant (<math>c(\xi)</math> maps <math>\Lambda^2</math> into <math>\Lambda^3</math>); only <math>\Lambda^{\text{even}}</math> is (even algebra) — the bridge must go through the fold, never through degree truncation (constraint on AP2). [E] Q-TARGET ENUMERATION (the v473 conjecture DECIDED): <math>\text{Tr } Q^2=d k^2 c_3^4=32c_3^4</math> with INTEGER <math>k</math> has exactly the supports <math>(d,k)=(2,4), (8,2), (32,1) = \{ \mathbb{Z}_2 , g_{\text{car}}+N_{\text{fam}}=\text{rank } E_8, 2^{g_{\text{car}}}=\dim \Lambda^\bullet\}</math> — minimal uniform solution <math>q=c_3^2=1/(64\pi^2)</math> per Fock mode; the two-form block <math>d=10</math> (the “pair sector” conjecture) and the fiber <math>d=16</math> need irrational multipliers <math>\sqrt{16/5}, \sqrt{2} \Rightarrow</math> KILLED in uniform form; bonus identity <math>\text{Tr } Q^2/\delta_{\text{top}}=32/48=2/3=\dim \Lambda^\bullet/\Omega_{\text{adm}}</math>. [C] the physical choice among the three admissible supports; [O] AP2 compression + <math>R^2</math> mechanism stay open, no marker moves. Mixed exact: integer Fock matrices (numpy, exact in double) + symbolic sympy (weights/enumeration Wolfram-mirrored). [E][C][O]</p> |
| v475_entropic_scalaron_gate.py | <p>GRAV.ENTROPIC.SCALARON.01: the <math>R^2</math> kill test of the entropic-action bridge EXECUTED (work package 5 of v473) + the explicit Lorentzian-positivity witness. [E] MAX-SYMMETRIC EIGENVALUES (her Appendix-B flattening verified): <math>\tilde{R}\tilde{g}^{-1}</math> has eigenvalues EXACTLY <math>\{R; R/4 \times 4; R/6 \times 6\}</math> on a general diagonal 4d metric, incl. the <math>6\times 6</math> two-form flattening. [E] EXACT VACUUM <math>f(R)</math>: <math>\mathcal{L}_B(R)=-[\ln(1-\beta R)+4\ln(1-\beta R/4)+6\ln(1-\beta R/6)]=3\beta R+\frac{17}{24}\beta^2 R^2+O(R^3)</math> — the 3 re-derives her Eq. (45) (= the v473 pin), <math>\frac{17}{24}=\frac{1}{2}(1+\frac{1}{4}+\frac{1}{6})</math> is the EXACT tensorial <math>R^2</math> factor. [E] RAW SCALARON TRANS-PLANCKIAN: with <math>\beta'=c_3/6</math> both routes (Starobinsky matching AND <math>f'/(3f'')</math>) give <math>m_{\text{raw}}^2=\frac{4608\pi^2}{17}M_{\text{Pl}}^2</math>, <math>m_{\text{raw}}\approx 51.7 M_{\text{Pl}}\approx 1.3\times 10^{20}</math> GeV — HEAVY, not light (TFPT: <math>c_3^{7/2}M_{\text{Pl}}=3.06\times 10^{13}</math> GeV); required enhancement EXACTLY <math>m_{\text{raw}}^2/m_{\text{TFPT}}^2=\frac{72}{17}(8\pi)^9\approx 1.69\times 10^{13}</math> in mass<sup>2</sup> — v473's interpretation 2 (the TFPT scalaron as the light <math>\mathcal{G}</math>-trace mode) is KILLED in naive form. [E] DOMAIN: first log pole at <math>R=1/\beta=384\pi^2 M_{\text{Pl}}^2</math> (trans-Planckian) — the raw action is well-defined at all sub-Planckian curvatures; the obstruction is the MASS, not the domain. [E] LORENTZIAN WITNESS: a timelike gradient gives <math>Gg^{-1}</math> eigenvalue <math>1-\alpha v^2\leq 0</math> for <math>v^2\geq 1/\alpha</math> (ln undefined); spacelike/Euclidean positive for all <math>v</math> — the v473 [C] caveat exhibited, the OS/reflection-positive route sturdier. [C] VERDICT: interpretation 1 survives (the entropic action covers the Einstein + <math>\Lambda</math> level), 2 is dead naive, 3 (KMS-spectral renormalisation) is the ONLY surviving <math>R^2</math> route. [O] unchanged: AP2 compression + the <math>R^2</math> gate; no marker moves. Exact (sympy, Wolfram-mirrored). [E][C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v476_entropic_compression_toy.py | <p>GRAV.ENTROPIC.COMPRESS.01: the AP2 compression conjecture of the entropic-action bridge (v473) made WELL-POSED on an exactly solvable model. Numerical facts on a staggered-mass chain: the ground-state covariance is a PROJECTION (pure bulk, thermal boundary — the seam situation); the compression <math>C_A=PCP</math> has spectrum strictly inside <math>(0,1)</math> with finite Peschel <math>K=\ln((1-C_A)/C_A)</math> and <math>S&gt;0</math> (v155 in the bridge context). ORDER OBSTRUCTION (the reading DECIDED): on the pure bulk <math>f(x)=x/(1-x)</math> is SINGULAR on <math>\text{spec}(C)=\{0,1\}</math> — the literal operator-side reading <math>Pf(C)P</math> of the v473 conjecture is ILL-POSED while <math>f(PCP)</math> is finite: the compression identity can only be read STATE-SIDE (build <math>\Delta_\Sigma</math> from the COMPRESSED relative metric), matching Bianconi's own local-metric construction — AP2 retyped, not weakened. [E] BLOCK ALGEBRA (symbolic): <math>[C^2]_{AA}-(C_{AA})^2=BB^t</math> and <math>[C^3]_{AA}-(C_{AA})^3=ABB^t+BB^tA+BDB^t</math> — first order in the cross block vanishes identically, so for ANY analytic <math>f</math> the two readings agree to SECOND order: the modular (entanglement) content lives exactly in that quadratic correction. GAP CONTROL at the bounded (covariance) level: the bulk identity <math>f(C_T)=e^{-h/T}</math> holds to <math>10^{-11}</math> relative; the mismatch obeys the quadratic law <math>d \leq x^2</math> and falls with the gap in the gapped regime, the decoupled cut agrees EXACTLY — the two readings converge in the gap-dominated regime, where TFPT operates (<math>\Delta_{\text{eff}}&gt;0</math>, v76/v337). [C] the retyped conjecture; [O] AP2 stays open (the continuum seam statement); no marker moves. Numerical (numpy lattice + one symbolic block identity), Python-only by nature. [C][O]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v477_entropic_scaleflow.py       | <p>GRAV.ENTROPIC.SCALEFLOW.01: the scale-flow representation of the entropic action — v475's surviving interpretation 3 typed PRECISELY: the <math>(72/17)(8\pi)^9</math> gap collapses to ONE moment condition on the scale weight, satisfied by the SAME KMS moment TFPT already fixes (v36: <math>f_0=6(4\pi)^2/c_3^7</math>); zero new dials, nothing closes. [E] SCALE-FLOW IDENTITY: <math>-\ln a = \int_0^\infty \frac{dt}{t}(e^{-ta}-e^{-t})</math> (symbolic) <math>= 2 \int_0^\infty \frac{dx}{x}(e^{-a/x^2}-e^{-1/x^2})</math> (<math>t=1/x^2</math>, <math>10^{-20}</math> quadrature) — Bianconi's log action IS the FLAT scale-integral of relative heat-kernel actions; TFPT's <math>S_{\text{rel},\chi}</math> evaluates ONE KMS scale with a weight <math>f</math>: the bridge is a choice of SCALE MEASURE. [E] MOMENT DICTIONARY: a weight <math>w(t) dt/t</math> gives <math>3\beta R \mu_1 + \frac{17}{24}\beta^2 R^2 \mu_2</math> (<math>\mu_1 = \int w e^{-t} dt</math>, <math>\mu_2 = \int w t e^{-t} dt</math>); the flat weight has <math>\mu_1=\mu_2=1</math> = the v475 raw coefficients — the raw action is the unit-moment point of a moment family. [E] THE ONE MOMENT CONDITION: with the weight-dressed EH pin <math>\beta' \mu_1=c_3/6</math> the scalaron is <math>m^2=\frac{4608\pi^2}{17}\frac{\mu_1^2}{\mu_2}M_{\text{Pl}}^2</math>; demanding <math>m^2=c_3^7 M_{\text{Pl}}^2</math> forces EXACTLY <math>\mu_2/\mu_1^2=\frac{72}{17}(8\pi)^9</math> — the v475 kill-test number IS a moment ratio; and the closure identity <math>\frac{4608\pi^2/17}{(72/17)(8\pi)^9}=c_3^7</math> holds IDENTICALLY: the 13 orders are a scale-measure datum, not a bridge mismatch. [E] v36-CONSISTENCY: <math>f_0=6(4\pi)^2/c_3^7 \Leftrightarrow M^2/M_{\text{Pl}}^2=c_3^7</math> — the same mass from both parametrisations, ZERO new dials. [C] a CONSISTENCY statement, not a derivation (the KMS weight is TFPT input; the entropic action supplies the Einstein + <math>\Lambda</math> level and the scale-flow FORM, TFPT supplies the measure); negative side-record: the exact lattice-BW commutator attempt for AP2 (Peschel–Eisler simple forms) did NOT hold on the half-filled open chain (kept out of the suite, logged). [O] unchanged: the <math>R^2</math> gate and v359's typing. Exact (sympy + one quadrature, Wolfram-mirrored). [E][C][O]</p> |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v478_entropic_continuum_legs.py  | <p>GRAV.ENTROPIC.LEGS.01: first computable steps on the TWO remaining legs of the entropic-action bridge (v473–v477). LEG A (AP2 continuum): the compressed critical interval has <math>S(L)=(c/3)\ln L+k</math> with <math>c_{\text{est}}=1.00089/1.00038/1.00021</math> (monotone <math>\rightarrow</math> the Dirac <math>c=1=2\times\frac{1}{2}</math>, the v450 reading; gapped control <math>\sim 6\times 10^{-8}</math>, area law); the Peschel modular Hamiltonian <math>K=\ln((1-C_A)/C_A)</math> organises on the CHM weight <math>\beta(x)=x(L-x)/L</math> (corr 0.87<math>\rightarrow</math>0.99, plateau drift shrinking; constants deliberately NOT asserted — the lattice EH is only asymptotically local); even-range bands vanish identically (particle-hole, <math>\sim 10^{-36}</math>), odd tail 1.8% parabola-enveloped — the state-side <math>\Delta_\Sigma</math> (v476’s forced reading) FLOWS TO the CHM/BW geometric form that TFPT’s Einstein derivation consumes (v323/v358): the bridge’s modular side and TFPT’s gravity side MEET in the continuum limit. LEG B (the measure): [E] single-scale corollary — <math>d\mu=\delta(t-t_0)dt</math> gives <math>\mu_2/\mu_1^2=e^{t_0}</math> exactly, so the v477 condition forces <math>t_0=\ln\frac{72}{17}+9\ln(8\pi)=30.461</math> — ONE dimensionless KMS time, exact closed form; DECLINED: <math>t_0\neq h(E_8)=30</math> (difference 0.461; the near-miss is rejected per the v354/v355 no-free-pattern rule); deriving the measure from the entropic structure stays OPEN. [C] the meeting point; [O] both legs, no marker moves. High-precision numerical (mpmath, 50 digits) + one exact corollary, Python-only by nature. [C][O]</p>                                                                                                                                                                                                                                    |
| v479_kronheimer_quiver_bridge.py | <p>SEAM.KRONHEIMER.01: the R3 “combinatorial-to-geometric bridge” of the <math>\det K=1</math> keystone (v344 — “the rewrite attractor graph IS the du Val singularity”) is an ESTABLISHED THEOREM: Kronheimer’s ALE hyper-Kähler quotient construction + Torelli classification (J. Diff. Geom. 29 (1989) 665 and 685), with ALL finite input data already compiler outputs. [E] MARKS = NULL = PERRON: <math>C_{\text{aff}}\delta=0</math> and <math>A\delta=2\delta</math> on the affine-<math>E_8</math> McKay graph; multiset <math>\{1, 2, 2, 3, 3, 4, 4, 5, 6\}</math> = the <math>2I</math> irrep dimensions = the v312 rewrite-attractor Perron vector. [E] DIMENSION COUNT: <math>\dim_{\mathbb{R}} M - 4\dim_{\mathbb{R}} G = 4(\sum_{\text{edges}} d_i d_j - \sum d_i^2 + 1) = 4</math> — the hyper-Kähler quotient of the marks quiver is 4-real-dimensional (the <math>\mathbb{C}^2/\Gamma</math> geometry); <math>\sum_{\text{edges}} d_i d_j = \sum d_i^2 = 120</math> forced by the null-vector identity. [E] GAUGE DATUM: <math>\sum \delta_i^2 = 120 =  2I  =  \mu_4  h(E_8)</math>, <math>h(E_8)=30= \mathbb{Z}_2 N_{\text{fam}}g_{\text{car}}</math>. [E] RESOLUTION: <math>8=\text{rank } E_8</math> exceptional spheres with intersection form <math>-\text{Cartan}(E_8)</math>, <math>\det=1</math> and SNF = identity (the Poincaré-sphere link = the <math>\det K=1</math> face, v232/v344); deformation space <math>\mathfrak{h} \otimes \mathbb{R}^3</math>, <math>\dim 3 \cdot 8 = 24</math>. [C] the theorems are CITED, not re-proved (the same import class as NPW26/MMST/AGT, v424/v336/v459). [O] the residual premise TRANSFORMS, it does not vanish: “the raw seam supplies ALE hyper-Kähler data asymptotic to the <math>(2, 3, 5)</math> cone” = the SAME single arrow as SEAM.EQUIV.01 (v346 L2); no gate closes. Exact (sympy; Wolfram mirror added, counted with the verified 2026-07-21 engine run). [E][C][O]</p> |

|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v480_multilocal_<br>four_interval.py | <p>QGEO.MULTILOCAL.01: the four <math>\mu_4</math> marks make the seam circle a FOUR-INTERVAL free-fermion geometry — the class whose multi-interval modular theory is EXACTLY KNOWN (Casini–Huerta mixing term; Longo–Xu multi-interval subfactors; Rehren–Tedesco multilocal fermions; KLM: holomorphic <math>\Leftrightarrow</math> trivial multi-interval inclusion, <math>\mu=1</math> — the SAME one bit as <math>\det K=1</math>). On the exactly solvable antiperiodic critical ring (<math>N=256</math>, <math>Q=64</math>, <math>\ell=48</math>): [E] BINARY CLOCK: the quarter-turn clock is a signed permutation with <math>\rho^4 = -1</math> EXACTLY — the fermionic <math>\mu_4</math> clock is the order-8 double-cover lift (the same <math>\mathbb{Z}_2</math>-lift pattern as <math>2I</math> over <math>I</math>). [E] EXACT SECTOR DECOUPLING: the primitive-8th-root character projectors resolve the identity and commute with the reduced covariance at <math>10^{-15}</math> (the Rehren–Tedesco diagonal 4-fold-cover isomorphism at covariance level). [E] COVER/TWIST: each sector kernel is the SINGLE-interval quarter-ring kernel with boundary twist <math>\lambda_k</math>; the union of sector spectra = the full 4-interval spectrum at <math>10^{-14}</math>. [E] CLOCK INVARIANCE MANIFEST: <math>\rho C \rho^{-1} = C</math> at <math>10^{-14} \Rightarrow [\rho, K]=0</math> by functional calculus — <math>\omega \circ \rho = \omega</math> HOLDS at the 4-interval state level; NEGATIVE CONTROL: displacing ONE interval by one site re-couples the sectors at <math>10^{-2}</math>. CONJUGATE-POINT MIXING (numerical): every cross-interval row of <math>K</math> peaks on <math> s'-s  \leq 2</math> at both sizes — the lattice shadow of the Casini–Huerta mixing term. [C] the continuum multi-interval theory is CITED; [O] the raw-seam premise (QGEO.SYM.01/SEAM.EQUIV.01) stays OPEN — mechanism exhibited, not closed. Numerical (numpy), Python-only by nature. [E][C][O]</p>                                                                     |
| v481_seesaw_<br>carrier_ladder.py    | <p>FLAV.NUSCALE.02: the absolute neutrino-mass scale under the CARRIER Yukawa normalisation <math>y_\nu = y_t</math> — FLAV.NUSCALE.01's two-parameter <math>(y_\nu, M_R)</math> trade-off collapses to ONE parameter and the required <math>M_R</math> lands INSIDE the compiler's own PS window; the nearby integer <math>c_3</math>-rung is explicitly DECLINED at 1-loop (v354/v355). CANDIDATE class (genre v467/v468); the frozen record (v84) is untouched and NO gate closes. CARRIER NORMALISATION (conjectured premise; named premise): one <math>SO(10)</math> 16 per family + minimal Yukawa sector (<math>\mathbf{10}_H</math> / PS (1, 2, 2)) <math>\Rightarrow y_\nu = y_t</math> at the matching scale — the trade-off collapses to <math>M_R</math> alone. INVERSION INSIDE THE WINDOW (numerical): the observed <math>m_3=0.0503</math> eV demands <math>M_R=9.3 \times 10^{13}</math> GeV, INSIDE <math>[M_{PS}, M_{GUT}] = [4.2 \times 10^{13}, 2.4 \times 10^{15}]</math> (v249), at <math>\log_{c_3}(\bar{M}_{Pl}/M_R) = 3.15</math> (<math>y_\nu=1</math> gives the structureless 2.58 — the old FLAV.NUSCALE.01 number). [X] INTEGER-RUNG HONESTY GATE: <math>M_R = c_3^3 \bar{M}_{Pl} = 1.53 \times 10^{14}</math> GeV predicts <math>m_3 = 0.030</math> eV (40% low at 1-loop; ADKLR <math>\kappa</math> run-down factor 0.794) — NEAR the rung (3.15 vs 3), NOT ON: the ladder pin is DECLINED; the decision computation is NAMED (2-loop SM + explicit PS threshold matching). FALSIFIABLE BAND (numerical): over the PS window <math>m_3</math> spans <math>[0.002, 0.115]</math> eV bracketing the observation; the <math>M_{PS}</math> end (<math>\Sigma \sim 0.124</math> eV) is already in tension with DESI <math>\sim 0.072</math> — cosmology cuts the window from below; the NO floor <math>\Sigma m_\nu = 0.059</math> eV stays the falsifiable edge (v272). [C] / [O] candidate class; the absolute scale stays formally open. Numerical (explicit 1-loop RG: gauge/<math>y_t/\lambda</math> up, ADKLR Weinberg-operator down), Python-only by nature. [C][O]</p> |

|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v482_seesaw_rung_<br>decision.py    | FLAV.NUSCALE.03: the decision computation NAMED by v481, EXECUTED in bracketed (assumption-robust) form — the integer rung $M_R = c_3^3 \bar{M}_{Pl}$ is EXCLUDED as an unstructured exact pin, conditional on the carrier premise $y_\nu = y_t$ . THE GAP: central $m_3(\text{rung}) = 0.0301$ eV vs observed 0.0503 — rescue factor $\times 1.670$ (+67%, 0.154 $c_3$ -rungs). BRACKETED EXCLUSION: with $m_t(\overline{\text{MS}}) \pm 3$ GeV ( $> 3\sigma$ ), $\alpha_3^{-1} \mp 0.10$ ( $> 3\sigma$ ), a $\pm 10\%$ band on the ADKLR $\kappa$ run-down and the PS-leg Yukawa beta scaled $\times [0.5, 1.5]$ , the largest single shift is $\times 1.10$ and the ALL-favourable combination reaches only $\times 1.165$ — far below $\times 1.670$ : the v481 1-loop miss is NOT an RG artifact. [C] NAMED ESCAPE, RECORDED AND DECLINED: only a third-generation Majorana STRUCTURE factor $r \sim 1.67$ revives the rung; post-hoc $r_{\text{needed}} = 1.6696$ sits 0.18% from $g_{\text{car}}/N_{\text{fam}} = 5/3$ — no mechanism forces a 3/5 Clebsch on $M_{R,3}$ today, so this is a named coincidence with a named missing mechanism (PS Majorana-sector Clebsch), DECLINED per v354/v355 (the $t_0 \sim 30$ pattern of v478). [O] the v481 one-parameter window candidate (NO floor $\Sigma m_\nu = 0.059$ eV) never used the integer rung and STANDS; frozen record untouched; nothing closes. Numerical (explicit 1-loop RG + bracketed envelopes), Python-only by nature. [C][O][X]                                                                                                                                                                                                                                                                                                         |
| v483_pillowcase_<br>exact_traces.py | HYP.PHIO.GEOM.01: the GEOMETRIC side of the $\varphi_0^{\text{ret}}$ puncture target (HYP.PHIO.PUNCTURE.01/v408) is EXACT — every twisted/orbifold heat trace of the flat $\tau = i$ pillowcase is a $t$ -INDEPENDENT RATIONAL, so the $\pi^{-4}$ in $d_{\text{top}} = 48c_3^4$ cannot come from flat orbifold geometry at ANY order. [E] TWISTED TRACES EXACTLY 1: $\text{Tr}(\gamma e^{t\Delta}) = 1$ for $\gamma = \sigma(z \mapsto -z)$ , $\rho(z \mapsto iz)$ , $\rho^3$ at every tested $t \in [0.05, 3]$ (position-space Gaussian image sums / erf closed forms + 2d quadrature, residual $< 10^{-9}$ ; mode-space proof: only $n=0$ is $\gamma$ -diagonal) — $t$ -independent, no asymptotic tail. [E] ATIYAH–BOTT MATCH: $1 = 4 \times \frac{1}{4}$ ( $\det(1-d\sigma) = 4 =  \mu_4 $ ) and $1 = 2 \times \frac{1}{2}$ ( $\det(1-d\rho) = 2 =  \mathbb{Z}_2 $ ). [E] PILLOWCASE DATA EXACT: orbifold heat trace $= \frac{1}{2} \text{Tr}_{T^2} + \frac{1}{2}$ (contact term EXACTLY $\frac{1}{2} = 4 \times \frac{1}{8}$ per mark, all $t$ ); clock-equivariant trace exactly 1 (all $t$ ). [E]/[O] THE REDUCTION: the analytic content of $d_{\text{top}} = 48c_3^4 = \frac{3}{256\pi^4}$ must sit in the per-insertion COUPLING normalisation — $4 =  \mu_4 $ insertions of weight $c_3$ give $c_3^4$ , multiplicity $\Omega_{\text{adm}} = 48$ ; the bare $1/(2\pi)$ -propagator 4-cycle differs by the exact RATIONAL $\frac{3}{16}$ ; the ONE remaining [O] is the rule “per-mark weight = $c_3$ ” (seam zeta/Green normalisation, the same residual class as EM.WARD.02). The target narrows from “derive the term” to “derive the weight”; HYP.PHIO.PUNCTURE.01 stays open; no gate closes. Numerical verification of exact statements + sympy exact arithmetic; Python-only by nature. [E][O] |

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v484_seam_contact_unit.py       | <p>SEAM.CONTACT.UNIT.01: the shared “<math>c_3</math> per boundary insertion” rule of the two open analytic targets (ALPHA.QUILLEN.EXACT.01 ladder <math>\{0, 3, 6\}</math>;<br/> HYP.PHIO.PUNCTURE.01 per-mark weight <math>c_3</math>) is ONE identity and NOT a new unknown: it is the KMS seam unit <math>2\pi = 1/(4c_3)</math> with <math>\frac{1}{4} = 1/ \mu_4 </math> (v239) — one bare boundary propagator ORBIT-AVERAGED over the four marks. [E] UNIT CHAIN: <math>\frac{1}{2\pi} = 4c_3 =  \mu_4 c_3 =  \mathbb{Z}_2 \chi(S^2)c_3</math>. [E] MECHANISM DERIVED ON THE SEAM CIRCLE: <math>G(d) = -\frac{1}{\pi} \ln  2 \sin(d/2) </math> (polylog identity, 40 digits) takes INTEGER multiples of <math>c_3 \ln 2</math> at the <math>\mu_4</math> separations — <math>G(\pi/2) = -4c_3 \ln 2</math>, <math>G(\pi) = -8c_3 \ln 2</math>, so <math>G_{\text{marks}} = -4c_3 \ln 2 \cdot \text{circ}(0, 1, 2, 1)</math> with <math>\text{spec} = \{4, -2, 0, -2\}</math>; the <math>\mu_4</math>-invariant (orbit-averaged) insertion carries <math>(GV) _{\text{marks}} = -(c_3 \ln 2) C</math> EXACTLY, so the log-det contact expansion is exactly graded in <math>c_3</math> per insertion with integer cycle combinatorics <math>\text{Tr}(C^k) = 4^k + 2(-2)^k</math>. [E] SUITE-WIDE GRAMMAR: the <math>F_{U(1)}</math> ladder <math>\{0, 3, 6\}</math> (v3); <math>\varphi_0^{\text{ret}}</math> ladder <math>\{1, 4\}</math> (v37); the <math>\Lambda</math> prefactor <math>\frac{3}{4\pi^2} = (8\pi)^2 d_{\text{top}} = 48c_3^2</math> (v60) — the SAME multiplicity <math>\Omega_{\text{adm}}=48</math> as the puncture, at TWO insertions; the <math>g-2</math> seam loop divides by the same <math>2\pi = 1/(4c_3)</math>. [C]/[O] THE MERGE: the two tracked [O] targets collapse into ONE named analytic step — the diagonal (self-energy) zeta-renormalisation at the marks + the state-multiplicity matching (<math>48 = \Omega_{\text{adm}}</math>, <math>41 = 10b_1</math>); the finite cycle sector is proven. Anti-numerology: the integers are forced by the square configuration; no target coefficient is claimed. Exact (sympy + 40-digit mpmath polylog); Python-only by nature. [E][C][O]</p>                                    |
| v485_contact_diagonal_closed.py | <p>SEAM.CONTACT.UNIT.02: the DIAGONAL channel of the merged analytic target (v484) settled at the computable level — the merged residual COLLAPSES ONTO THE KEYSTONE. [E] DIAGONAL ZERO AT THE KMS SCALE: the renormalised coincident-point Green function on circumference <math>\ell</math> is <math>G_{\text{reg}}(0; \ell) = \frac{1}{\pi} \ln(\ell/2\pi)</math> exactly — it VANISHES iff <math>\ell = 2\pi = 1/(4c_3)</math>, the v239 KMS seam circumference: the seam scale is the unique zero-self-energy scheme point. [E] THE LOG IS THE SCALE CHANNEL: rescaling gives <math>\frac{1}{\pi} \ln \kappa</math> and nothing else — matching the functional structure (<math>F_{U(1)}</math> carries exactly ONE log term, the transport <math>8b_1 c_3^6 \ln(1/\varphi_{\text{seam}})</math>; the <math>\varphi_0^{\text{ret}}</math> split is log-free); [C] reading: log = diagonal/scale channel, log-free = contact data at the KMS point. [E] CLOSED-FORM RESUMMATION (BFK route, v151 class): the finite-rank mark determinant resums exactly, <math>\det(I - uC) = (1 - 4u)(1 + 2u)^2</math> with <math>u = \varepsilon c_3 \ln 2</math> — all orders; the linear term is ABSENT precisely because the diagonal vanishes (<math>\text{Tr } C = 0</math>); the series matches v484’s <math>\text{Tr}(C^k) = 4^k + 2(-2)^k</math>. [E] WEIGHT DICHOTOMY: the SAME <math>48 = 3 \times 16</math> admissible states carry BOTH multiplicities — flat count <math>48 = \Omega_{\text{adm}}</math> (the <math>\varphi_0^{\text{ret}}</math> puncture) vs <math>Y^2/\text{loop}/\text{GUT-weighted } 41 = 10b_1 = 40 + 1</math> (<math>\text{Tr}_{16} Y^2 = \frac{10}{3}</math> exact, <math>\nu^c = 0</math>; Ginsparg <math>(3/5)(41/6) = 41/10</math>, v470) — one state set, two response weights. [C]/[O] CONSEQUENCE: with v484 EVERY finite/computable piece of the merged ALPHA.QUILLEN + PHIO.PUNCTURE target is proven; the single remaining [O] is the identification of the abstract seam <math>\zeta</math>-det with this glued mark determinant — a face of SEAM.EQUIV.01, exactly the v382 typing, now substantiated computationally. No gate closes. Exact (sympy + 30-digit mpmath + exact charge sums); Python-only by nature. [E][C][O]</p> |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v486_transfer_full_rule.py   | <p>HYP.REWRITE.02: the FULL physical transfer spectrum <math>\{1, (2/3)^6, (1/3)^6\}</math> (v54/v221) from ONE forced local rule — the lazy <math>\mathbb{Z}_2</math>-pair walk; the <math>(1/3)^6</math> mode, previously generator-less, gets its local-rule origin (sharpens v327, whose uniform rule produces <math>\{1, \frac{2}{3}, 0\}</math> and can never generate the third mode). [E]</p> <p>UNIQUENESS: for <math>M(s, h) = \begin{pmatrix} 1 &amp; 0 &amp; 0 \\ 0 &amp; s &amp; h \\ 0 &amp; h &amp; s \end{pmatrix}</math> (one absorbing family channel + SYMMETRIC <math>\mathbb{Z}_2</math> pair) the survival spectrum is <math>\{s+h, s-h\}</math>; demanding the physical pair <math>\{\frac{2}{3}, \frac{1}{3}\}</math> forces UNIQUELY</p> <p>(stay, hop, leak) = <math>(\frac{1}{2}, \frac{1}{6}, \frac{1}{3}) = (1/ \mathbb{Z}_2 , 1/( \mathbb{Z}_2 N_{\text{fam}}), 1/N_{\text{fam}})</math> — atom form recorded (honest direction: spectrum <math>\rightarrow</math> rates). [E] SIX-HAND GENERATION: over the order-6 = <math>2N_{\text{fam}} =  R^+(A_3) </math> hand, <math>\text{eig}(B^6) = \{\frac{64}{729}, \frac{1}{729}\}</math> exactly; decay gaps <math>6 \ln \frac{3}{2}</math> (the recovery gap, v76) and <math>6 \ln 3</math> (the subdominant gap, now generator-full). [E] SUPERSESSSION: the uniform rule's zero mode persists under every power — no iterate reaches <math>(1/3)^6</math>; its <math>\lambda_2</math> arity story (<math>\frac{2}{3} =  \mathbb{Z}_2 /N_{\text{fam}}</math>) is unchanged. [E] sub-stochastic, symmetric (detailed balance), absorbing democratic attractor unchanged (v317). [O] the arity <math>\{2, 3\}</math> stays the anchor input; the lazy-vs-uniform split is SELECTED by the physical spectrum, not yet first-principles-derived (named candidate: stay = <math>1/ \mathbb{Z}_2 </math> as the sheet-symmetric choice of the <math>\mathbb{Z}_2</math> involution). Exact (sympy); mirrorable, deferred to the next verified engine run. [E][O]</p> |
| v487_transfer_clock_rungs.py | <p>HYP.REWRITE.03: the lazy split <math>(\frac{1}{2}, \frac{1}{6})</math> is FORCED by the resummed clock — the v486 [O] 'split selection' closes onto v124 structure; sharpens HYP.REWRITE.02, no gate closes. [E] RUNG READING: the lazy rule's one-step spectrum is EXACTLY the complete clock ladder below the wall,</p> <p><math>\text{eig}(M) = \{1 - n/3 : n = 0, 1, 2\} = \{1, \frac{2}{3}, \frac{1}{3}\}</math>; v327's uniform rule puts its second pair mode ON the wall (<math>0 = 1 - 3/3</math>) — the degeneracy re-read as 'odd channel collapsed to the wall'. [E] DECK PARITY = RUNG INDEX: <math>[B, \sigma] = 0</math>; the <math>\sigma</math>-even pair mode carries rung <math>n = 1</math> (survival <math>\frac{2}{3}</math>), the <math>\sigma</math>-odd mode rung <math>n = 2</math> (survival <math>\frac{1}{3}</math>) — each clock step flips the deck parity; the structural home of the v486 parity assignment (<math>\omega_1</math> even-channel, <math>\omega_2</math> odd-channel). [E] FORCING: faithful ladder (no rung missing, no physical mode on the wall — definitional for a full-spectrum generator) + <math>\mathbb{Z}_2</math> equivariance + rates <math>\geq 0</math> force UNIQUELY both the split <math>(\frac{1}{2}, \frac{1}{6})</math> AND the assignment even <math>\rightarrow</math> rung 1, odd <math>\rightarrow</math> rung 2 (the swap needs <math>h = -\frac{1}{6} &lt; 0</math>); the 'sheet-symmetric choice' candidate is superseded by this proof. [E] BEND COROLLARY: <math>\omega_1/\omega_2 = \text{rate}(2)/\text{rate}(1) = \log_{3/2} 3</math> — the parity-comb tone ratio IS the v107/v124 bend of the pulsar-clock search. [O] the channel count <math>3 = N_{\text{fam}}</math> is forced by the clock wall; the ladder stays an exact identity on frozen spectra (semiclassical derivation R1 open); the arity <math>\{2, 3\}</math> stays the anchor input. Exact (sympy); mirrorable, deferred to the next verified engine run. [E][O]</p>                    |

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v488_majorana_clebsch_door.py   | <p>FLAV.NUSCALE.04: the 3/5 CLEBSCH DOOR of the seesaw rung, ENUMERATED AND CLOSED — v482's named escape (a third-generation Majorana factor <math>r \approx 1.6696</math>, 0.18% from <math>g_{\text{car}}/N_{\text{fam}} = 5/3</math>) is decided NEGATIVE at the group-theory level; the v481 window candidate stands as the honest endpoint. [E] NO RENORMALISABLE CHANNEL: <math>\text{sym}^2(\mathbf{16}) = 136 = \mathbf{10} + \mathbf{126}</math>; the <math>\overline{\mathbf{126}}</math> is NOT in the <math>E_8</math> hull <math>\{1, 10, 16, 45\}</math> (v247) — <math>M_R</math> only via the <math>d=5</math> operator <math>(\mathbf{16}_F \overline{\mathbf{16}}_H)^2/\Lambda</math> with the <math>E_8</math>-allowed <math>\mathbf{16}_H</math>. [E] CHANNEL LIST: <math>\mathbf{16} \times \overline{\mathbf{16}} = \mathbf{1} + \mathbf{45} + \mathbf{210}</math>; the hull admits singlet + <math>\mathbf{45}</math> insertions (<math>\mathbf{210}</math> absent). [E] CHARGE TABLE: <math>Y = T_{3R} + (B-L)/2</math> on all 16 states, <math>\text{Tr}_{16} Y^2 = \frac{10}{3}</math> (v485); <math>(B-L, T_{3R}, Y)(\nu^c) = (+1, -\frac{1}{2}, 0)</math>. [E] THE <math>\{2, 3\}</math>-SMOOTH THEOREM: every nonzero <math>\nu^c</math> channel weight <math>\{1, \frac{1}{4}, 1, -\frac{1}{2}, \frac{3}{8}\}</math> is <math>\{2, 3\}</math>-smooth and the multiplicative closure of <math>\{2, 3\}</math>-smooth rationals never contains <math>\frac{5}{3}</math>; the UNIQUE natural 5 of the embedding, <math>k_Y = \text{Tr} Y^2 / \text{Tr} T_{3L}^2 = \frac{5}{3}</math> (Ginsparg, v470), is a full-multiplet trace whose direction has <math>Y(\nu^c) = 0</math> EXACTLY — structurally decoupled from the Majorana operator. [E] GENERATION-BLINDNESS: the Clebsch is a family-space scalar; <math>\text{diag}(1, 1, \frac{3}{5})</math> cannot arise from group theory. [O] compiler-flavor inventory typed and declined: exact <math>\frac{3}{5}</math>'s only in wrong slots (<math>K</math> lepton gen2/gen1; <math>R + L</math> lepton gen3/gen2), no degenerate-base shape, no <math>M_R</math> link (v354/v355). Exact (Fraction/sympy); mirrorable, deferred to the next verified engine run. [E][O]</p> |
| v489_seam_modular_commutator.py | <p>SEAM.CCC.01: the chiral central charge <math>c_- = 8</math> measured DIRECTLY from the bulk ground state of the v367 seam lattice model, via the Kim–Shehab–Kim modular commutator <math>J(A, B, C) = i \text{Tr}(\rho_{ABC}[K_{AB}, K_{BC}]) = (\pi/3) c_-</math> on a <math>120^\circ</math> pie tripartition (PRL 128 (2022)) — the FIRST ground-state witness for premise (i) of SEAM.EQUIV.01 (<math>c_- = 8</math>) INDEPENDENT of both the Chern route (v367 FHS curvature) and the counting route (v378 KLM/det-Cartan): <math>J</math> is read off the entanglement data of the exact BdG ground state alone (Peschel covariance, <math>W = -2 \text{artanh } \Gamma</math>). [E] GROUND-STATE PURITY: <math>\text{eig}(i\Gamma) = \pm 1</math> to <math>6 \times 10^{-15}</math>. [E] PER-LAYER <math>c_- = \frac{1}{2}</math>: <math>c_- = 0.499998</math> at <math>L=32, R=12</math> (<math>0.499793</math> at <math>L=16 \rightarrow 0.500000</math> at <math>L=48</math>, dev <math>-1.8 \times 10^{-7}</math>). [E] CONTROLS: trivial <math>M=3 \rightarrow 0.000000</math>; orientation flip <math>M=-1 \rightarrow -0.499986</math>. [E] LAYER ADDITIVITY EXACT (<math>1.4 \times 10^{-14}</math>): <math>J</math> additive over decoupled layers, so the carrier value is <math>16 \times</math> the per-layer value. [E] 16-LAYER CARRIER <math>c_- = 8 = g_{\text{car}} + N_{\text{fam}}</math>: direct 16-layer run <math>7.9967</math> (<math>L=16</math>, tol <math>10^{-2}</math>; <math>L=24</math> gives <math>7.999781</math>), additivity route <math>8.0000</math> (tol <math>10^{-3}</math>). [E] CLIP INVARIANCE: <math>\varepsilon = 10^{-8}</math> vs <math>10^{-12}</math> moves <math>c_-</math> by <math>5 \times 10^{-8}</math>. [O] HONEST FENCE: pins <math>c_- = 8</math> on the LATTICE ground state (third independent witness); does NOT close SEAM.EQUIV.01 — the continuum scaling limit (MMST v336) stays [O], the <math>\mu_4</math> condensation <math>SO(16)_1 \rightarrow (E_8)_1</math> stays the cited KLM step (v378). Numerical (numpy), Python-only by nature. [E][O]</p>                                                                                                                        |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v490_seam_parity_census.py     | <p>SEAM.MU.01: the <math>T^2</math> spin-structure fermion-parity census for the v367 seam lattice model — the lattice ground-state witness of “<math>\mu_{\text{pre}}=4</math> before condensation” (step 1 of the v378 KLM chain) + the 16-fold-way bridge <math>\theta_v=1</math> with the MEASURED <math>\nu=2c_-=16</math> (v489). Ground-state parity per boundary-condition sector (AA, AP, PA, PP), determined TWICE: Read–Green TRIM product AND real-space Majorana Pfaffian sign (Schur), relative to the trivial <math>M=3</math> phase. [E] REAL-SPACE = BLOCH SANITY: twisted spectra match to <math>9 \times 10^{-15}</math>. [E] PER-LAYER CENSUS (+, +, +, -): TRIM <math>\equiv</math> Pfaffian in every sector — 3 even sectors, the <math>\nu=1</math> Ising signature. [E] 16 LAYERS <math>\Rightarrow \mu_{\text{pre}}=4</math>: parity<sup>16</sup>=+ in ALL four sectors <math>\Rightarrow</math> gauged torus <math>\text{GSD}=4=\mu(SO(16)_1)= \det \text{Cartan}(D_8) </math>. [E] 16-FOLD-WAY BRIDGE: <math>\theta_v=e^{2\pi i\nu/16}=1</math> EXACTLY at <math>\nu=2c_-=16</math> (vortex bosonic, condensable); rivals <math>\nu=1, 2, 8</math> excluded (not holomorphically condensable). [E] NON-DISCRIMINATOR FENCE: the fermionic Kitaev–Preskill TEE is identically zero — <math>\gamma_f=0.000001</math> (<math>M=1</math>) and <math>0.000000</math> (<math>M=3</math>) — an invertible fermionic phase has no TEE, so <math>\gamma_f</math> does NOT discriminate <math>(E_8)_1</math> vs <math>SO(16)_1</math> (both live only after gauging). [C] the KLM step <math>\mu_{\text{post}}=4/2^2=1</math> stays cited (the condensed model is interacting); the numerics pin only <math>\{c_-=8, \mu_{\text{pre}}=4, \theta_v=1\}</math> — the premise package of the condensation. [O] the continuum limit (MMST v336); SEAM.EQUIV.01 stays [O]. Python (numpy + scipy Schur + sympy exact <math>\theta_v</math>). [E][C][O]</p>                                                                      |
| v491_p2_partition_corollary.py | <p>P2.PARTITION.01: <math>g_{\text{car}}=5</math> as a COROLLARY of the four marks — the partition sharpening of v53 (sympy exact, no floats). THE LEMMA: a multiset of exactly 3 POSITIVE INTEGERS summing to 4 is unique — <math>\{1, 1, 2\}</math> — so <math>e=(e_1, e_2, e_3)=(4, 5, 2)</math> and <math>g_{\text{car}}=e_2=5</math>, <math> \mathbb{Z}_2 =e_3=2</math>, <math>N_{\text{fam}}=e_2-e_3=3</math> are COROLLARIES, not inputs; consistency closes as a fixed point <math>((2^4-1)/5=3=\text{rank } H^1=\#\text{marks}-1)</math>. NEGATIVE CONTROLS (every assumption load-bearing): drop positivity <math>\rightarrow 4</math> solutions, <math>e_2</math> ambiguous <math>\{0, 3, 4, 5\}</math>; sum 3 <math>\rightarrow e_2=3</math>; sum 5 <math>\rightarrow</math> not unique; 2/4 parts <math>\rightarrow e_2 \in \{3, 4\}/\{6\}</math>; Mehta–Seshadri RATIONAL weights <math>\rightarrow e_2=\frac{16}{3}</math> resp. <math>\frac{44}{9} \neq 5</math> (integrality comes from the Birkhoff–Grothendieck SPLITTING-TYPE typing, not from MS weights). [E] v53 SHARPENING: v53 needs all three targets (4, 5, 2); the partition needs only <math>e_1=4</math> — same unique <math>\{1, 1, 2\}</math>. [E] SUM RULE: <math>4 \times \frac{N-1}{2}=4</math> iff <math>N=3</math>; the v115 route <math> a _1= \mu_4  \text{tr}(A_0)=4</math>. INDEPENDENCE CHAIN: <math>\#\text{marks}=4</math> from v216 (P1-side, no <math>g_{\text{car}}</math> input); rank <math>H^1=3</math> pure topology (v137/v228); <math> a _1=4</math> <math>g_{\text{car}}</math>-free (par-deg-0/(U), v115). [C] HONEST RESIDUAL: P2 is NOT made axiom-free — the weight-TYPING postulate remains (integrality = splitting exponents; positivity = <math>h^0=0</math>, correlate v137 check 1; sum rule “given (U)”); AX.P2.01 stays a declared axiom; the <math>N_{\text{fam}}</math> direction reversal vs tfpt_constants is typed as an over-determination check, never double-counted. Exact (sympy); Wolfram-mirrored. [E][C]</p> |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v492_celestial_z4_orbifold.py | <p>CELEST.WP1.01: WP1 of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — the <math>E_8</math> <math>\mu_4</math>-glue grading (v128) IS the flat <math>\mathbb{Z}_4</math> monodromy of the glue-equivariant celestial chiral algebra on the <math>A_3</math> ALE space <math>\mathbb{C}^2/\mathbb{Z}_4</math> (Bittleston–Homans–Sharma, <a href="#">arXiv:2305.09451</a>, the <math>\mathbb{Z}_2</math>/Eguchi–Hanson case; Kronheimer–Nakajima flat connection at infinity). Sympy exact. [E] INNER GRADING: <math>h=(2, 2, 2, 2, 2; 0^4)</math> reads the glue class mod 4 on all 240 roots <math>\Rightarrow</math> glue <math>= \text{Ad}(\exp(2\pi i h/4))</math>, an order-4 torus element <math>=</math> flat <math>\mathbb{Z}_4</math> monodromy; the <math>A_3</math>-side detector <math>h'=(0^5; 1, 1, 1, -3)</math> reads the SAME class <math>=</math> the diagonal <math>(1, 1)</math> of the discriminant group <math>\mathbb{Z}_4 \times \mathbb{Z}_4</math> (the v92/v125 Lagrangian glue); <math>\mathbb{Z}_2</math> halfway <math>120 = \dim SO(16)</math>, <math>128 = \text{spinor}</math>. [E] <math>\mathbb{C}^2/\mathbb{Z}_4</math> IS the <math>A_3</math> singularity <math>XY=Z^4</math> (Molien table exact; Hilbert series <math>(1+t^4)/((1-t^2)(1-t^4))</math>; conjugation symmetry <math>N[d][1]=N[d][3]</math>). [E] EQUIVARIANT SECTOR CLOSES: <math>D[d]=60(d+1)</math> even / <math>64(d+1)</math> odd — uniform per parity ONLY because <math>\dim \mathfrak{g}_j=(60, 64, 60, 64)</math>; zero modes <math>(d=0) = \mathfrak{g}_0 = \text{carrier } D_5 \oplus A_3 + \text{Cartan} = 60</math>; density <math>62/248=1/4=1/ \mathbb{Z}_4 </math>; <math>\text{EH}/\mathbb{Z}_2</math> halfway towers <math>120/128</math>. [E] CHARACTER: <math>\Theta_{E_8} = \sum_j \Theta_{C_j}</math>; shell <math>1 = (52, 64, 60, 64)</math> from the LATTICE; the 4 sector characters <math>\Theta_{C_j}/\eta^8</math> sum exactly to <math>\chi_{(E_8)_1} = 1 + 248q + 4124q^2 + 34752q^3</math> (v377); sector weights <math>h_{D_5}=(0, \frac{5}{8}, \frac{1}{2}, \frac{5}{8})</math>, <math>h_{A_3}=(0, \frac{3}{8}, \frac{1}{2}, \frac{3}{8})</math> = the v92/v125 discriminant form <math>(5x^2+3y^2)/8 \bmod 1</math>; glue diagonal <math>h=(0, 1, 1, 1)</math> INTEGER = v125 isotropy = local extension to <math>(E_8)_1</math>. [E] CRITICAL CORRECTION: the <math>A_3</math> deck <math>\text{diag}(i, i^{-1})</math> acts on the celestial sphere as <math>z \mapsto -z</math> (projective order 2, the sheet flip), NOT as the order-4 clock <math>z \mapsto iz</math>; the clock is the <math>U(2)</math> phase <math>\text{diag}(i, 1)</math> (order 4, fixed <math>\{0, \infty\}</math>, free <math>\mu_4</math> orbit — all v180 properties; normalises the deck, <math>\det=i</math> rotates the holomorphic symplectic form by the <math>\mu_4</math> generator); exact spin bridge <math>(\text{spin clock})^2 = \text{deck}</math>, spin group <math>\mathbb{Z}_8</math>, <math>8=2 \mu_4 </math> (the <math>c_3=1/(8\pi)</math> winding integer). [E] clock-invariant <math>A_3</math> deformation = the 1-parameter family <math>XY=Z^4+a_0</math>; its 4 branch points are ONE <math>\mu_4</math> orbit with cross-ratio 2 (v179 clock orbit; v168/v214 pillowcase <math>j=1728</math>). [E] NEGATIVE CONTROLS: false spatial action <math>\text{diag}(i, i)</math> killed three ways (<math>\det=-1 \notin SL(2, \mathbb{C})</math>); Poisson closure fails 14/14; grades unsymmetric); false glue breaks additivity on 3112/6720 root pairs; rigidity: only <math>\text{Aut}(\mathbb{Z}_4)</math> relabelings additive. [C] VERDICT B: match under the ONE named identification <math>\text{clock}^2=\text{deck}</math> on the sphere (sheet-<math>\mathbb{Z}_2</math> spin bookkeeping). [O] structural arithmetic ONLY — no celestial duality constructed; CELEST.SEAM.01 (WP2–WP5) stays a research contract; SEAM.EQUIV.01 stays [O], untouched. Exact (sympy). [E][C][O]</p> |

|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v496_celestial_<br>wp4_character_<br>shadow.py | <p>CELEST.WP4.01: WP4 of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — the <math>(E_8)_1</math> character <math>E_4/\eta^8</math> against the glue-equivariant <math>E_8[\mathbb{C}^2]</math> S-algebra: the contract’s “type mismatch, head-on”. Exact integer/Fraction/sympy, no floats. [E] BASE: v492 replication <math>(240 = 52+64+60+64, \text{dims with Cartan } (60, 64, 60, 64))</math>; equivariant tower <math>D[d] = 60(d+1)</math> even / <math>64(d+1)</math> odd; cumulative generator count QUADRATIC — <math>\sum_{d \leq s} D[d] = 31s^2 + 92s + 60</math> (even) with leading <math>31 = k + h^\vee</math> (the Sugawara denominator, an arithmetic note); [C] CP Table 1 (arXiv:2201.02595): <math>J[m, n]</math> carries 2d spin <math>1 - (m+n)/2</math>, UNBOUNDED BELOW along the tower <math>\Rightarrow</math> no rational VOA (<math>L_0</math> bounded below) contains the towers as graded pieces. [E] HILBERT SERIES: <math>\chi_{\text{sp}}(t) = (60+128t+60t^2)/(1-t^2)^2</math> (palindromic numerator, value 248 at <math>t=1</math>); ALL <math>\mu_4</math> collapses <math>w \in \{1, -1, i, -i\}</math> and the <math>SU(2)_+</math> primary slice <math>(60+64t)/(1-t^2)</math> fail to start <math>(1, 248, \dots)</math> — the “row sum” route fails at the first coefficient. [E] CHARACTER SIDE:</p> <p><math>\chi_{(E_8)_1} = E_4/\eta^8 = (1, 248, 4124, 34752, 213126, 1057504, 4530744)</math> exact through <math>q^6</math> (machinery cross-check <math>qj = E_4^3/\eta^{24} = (1, 744, 196884, 21493760)</math>); theta split (shell <math>1 = (52, 64, 60, 64)</math>), sector currents <math>(60, 64, 60, 64)</math>, glue-diagonal <math>h = (0, 1, 1, 1)</math> INTEGER (v125 isotropy = locality); Sugawara <math>c = 248/31 = 8 = 2 \mu_4  = g_{\text{car}} + N_{\text{fam}}</math>. [E] BRIDGES: zero-mode slice <math>D[0]=60=</math> the <math>C_0</math>-sector current count EXACTLY; the single-line jet slice <math>z_1^d</math> cycles <math>(60, 64, 60, 64)</math> sector by sector; BOUNDARY/PERIOD LIMIT: one full <math>\mu_4</math> period of loop energies carries <math>\dim \mathfrak{g}_{n \bmod 4} = (64, 60, 64, 60)</math>, sum = 248 EXACTLY — the single-particle level of the <math>248q</math> stage; 248 is NOT a jet-tower dimension (<math>d \leq 100</math>) — only the period collapse produces it; BUT the loop Fock at integer level 1 counts <math>897266 \gg 248</math>: the rational truncation is NOT in the jet/loop algebra. [E] MISMATCH LOCALISED THREE WAYS: (a) GRADING (spin unbounded below; 248 no tower dimension); (b) GROWTH: jet Fock <math>f = (1, 128, 8436, \dots)</math> vs <math>\chi = (1, 248, 4124, \dots)</math> TWO-SIDED (<math>f_1 &lt; \chi_1</math> undercount, <math>f_2 &gt; \chi_2</math> overcount), <math>f_n/\chi_n</math> strictly increasing <math>n = 1..12</math>; Meinardus poles <math>s=2</math> vs <math>s=1 \Rightarrow</math> growth exponents <math>n^{2/3}</math> vs <math>n^{1/2}</math>, asymptotically DISJOINT; (c) TRUNCATION: the level-2 null ideal deletes EXACTLY <math>27000 = 30^3 = (h^\vee)^3</math> (<math>\text{Sym}^2(248) = 1+3875+27000</math> [[C] standard]; the character keeps <math>4124 = 1+248+3875</math>) — NO analogue in the jet algebra (level 1 agrees: <math>248 = 248</math>). [E] KILL-TEST K4, three-way: (i) exact realisation NO; (ii) boundary-limit realisation PARTIAL YES — current stratum, period sum 248, integer glue weights and theta split hold exactly; the missing piece is precisely the rational truncation, which must come from a scaling/compactification limit — the SAME structure as the MMST scaling-limit route of SEAM.EQUIV.01 (v336/v449: the rational net exists in the LIMIT of the lattice collar, not in the pre-limit algebra); (iii) the hard mismatch is exactly located; K4 does NOT degrade the contract to “<math>E_8</math> admissible” (the sector arithmetic holds exactly). [C] VERDICT B(ii): the <math>(E_8)_1</math> character is a BOUNDARY/LIMIT SHADOW of the equivariant S-algebra, not a conformal block of it in the bulk grading — WP4 sharpens into a statement of SEAM.EQUIV.01 type. [O] the constructive boundary limit itself (which limit, which topology, convergence) stays OPEN and belongs to WP5/SEAM.EQUIV.01; SEAM.EQUIV.01 stays [O], untouched. Exact (integer/Fraction/sympy). |---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v497_celestial_<br>wp5a_null_ideal.py | <p>CELEST.WP5A.01: WP5a of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — “the null ideal from the limit”, the first constructive milestone of WP5 (the v496 boundary-limit shadow made precise). Exact integer/Fraction arithmetic, no floats. [E] BASE: v492/v496 replication (glue dims (60, 64, 60, 64), equivariant tower <math>D[d]</math>, <math>\chi_{(E_8)_1} = E_4/\eta^8</math> exact through <math>q^6</math>, <math>\mu_4</math> period sum 248). [E] STABILISATION THEOREM: a one-parameter family <math>\chi_w</math> of graded Fock characters on the CHIRAL jet generators (loop energy <math>m</math>, radial number <math>r</math>; <math>E_w = m + wr</math> in quarter units <math>u = q^{1/4}</math>); <math>w=2</math> IS the chiral jet grading (generator counts 64, 120, 128, 180, 192, 240, 256, 300 per degree); the <math>u^n</math> coefficient of <math>\chi_w</math> equals the quarter-moded loop Fock for ALL <math>w \geq n+1</math> and is STRICTLY larger for every <math>w \leq n</math> (<math>n \leq 8</math>, <math>w \leq 10</math>): the boundary reading is the precise coefficientwise limit <math>\varepsilon = 1/w \rightarrow 0</math> with explicit threshold <math>w = n+1</math> — a limit of a series, not a slice; convention clarified: 897266 is the quarter-moded loop Fock at <math>u^4 = \text{INTEGER level 1}</math> (v496). [E] NULL IDEAL DERIVED, NOT CITED: Freudenthal multiplicities (unit-tested on the adjoint) + Weyl dimension formula + generic character peeling in the standard <math>E_8</math> frame DERIVE</p> <p><math>\text{Sym}^2(248) = V(2\theta) \oplus V(\omega) \oplus V(0) = 27000 + 3875 + 1</math> (peeling residual exactly zero; independent Weyl-orbit cross-check); <math>27000 = 30^3 = (h^\vee)^3</math> exactly;</p> <p><math>C_2 = (124, 96, 0)</math>, Dynkin indices 6750/750; level-1 integrability <math>\langle 2\theta, \theta^\vee \rangle = 4</math>, <math>\langle \omega, \theta^\vee \rangle = 2 \Rightarrow</math> the only level-1 primary is the vacuum ([C] Kac, used through its counting consequence); level-2 quotient <math>31124 - 27000 = 4124 = 1 + 248 + 3875</math> EXACTLY. [E] TWO ROUTES, ONE NUMBER: the <math>\mu_4</math> theta-split sector characters summed at <math>q^2 = (1036, 1024, 1040, 1024)</math> give the SAME 4124 — the independent lattice route hits the Fock quotient exactly; at <math>q^3</math>: <math>34752 = \chi_3</math>. [E] NEGATIVE CONTROLS: <math>SO(16)_1</math> through the SAME pipeline —</p> <p><math>\text{Sym}^2(120) = 5304 + 1820 + 135 + 1</math> derived (FOUR components vs <math>E_8</math>’s three), <math>5304 \neq 14^3 = 2744</math> (the <math>h^\vee{}^3</math> identity is NOT generic), quotient</p> <p><math>7380 - 5304 = 2076 = \Theta_{D_8}/\eta^8</math> at <math>q^2</math> (the pipeline validated on a second algebra), block weights <math>(0, \frac{1}{2}, 1, 1)</math> do NOT fuse into one local character (four-block theory) vs <math>E_8</math>’s integer <math>(0, 1, 1, 1)</math>; false periodisation: only <math>P = 4 =  \mu_4 </math> gives 248 (<math>P=1: 64</math>, <math>P=2: 124</math>, <math>P=8: 496</math>); swapped glue breaks the zero-mode anchor (<math>64 \neq 60</math>). [C] named identifications: “radial decoupling = MMST collar thickness <math>\rightarrow 0</math>” (the v336/v449 lattice-collar route has the same two-step shape), not a computed isomorphism; the Kac singular vector only via its counting consequence. [O] HONEST LIMIT: the limit does NOT generate the truncation — the singular vector as an OPERATOR in the limit net stays open (WP5b); the GNS limit state (kernel <math>\supseteq</math> ideal) and local normality / Haag duality of the limit net stay open (WP5c/WP5d); the celestial route now has the SAME two-step shape as MMST (limit + maximal ideal), with the ideal quantitatively fixed;</p> <p>SEAM.EQUIV.01 stays [O], untouched. Exact (integer + Fraction). [E][C][O]</p> |

|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v498_celestial_<br>wp5b_singular_<br>vector.py | <p>CELEST.WP5B.01: WP5b of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — “the singular vector as an operator”, the second constructive milestone of WP5 (v497 fixed the ideal’s size and location; WP5b constructs the deleting object). Exact integer/Fraction arithmetic, no floats, deterministic. [E] CONSTRUCTION: <math> s\rangle = (E_{-1}^\theta)^2 0\rangle</math>, <math>\theta</math> the highest root, weight <math>2\theta</math> (the top of the 27000), level 2 = 8 quarter units = <math>q^2</math> (an INTEGER level); the Chevalley/Frenkel–Kac basis is MACHINE-built (bimultiplicative 2-cocycle, asymmetry on all 57600 pairs; the <math>[e_\alpha, e_{-\alpha}]</math> sign FORCED by Jacobi, <math>\text{SGN} = -1</math>; <math>\kappa</math> DERIVED from invariance, <math>\kappa(\theta^\vee, \theta^\vee) = 2</math>; Jacobi exact on all 57600 <math>\mathfrak{sl}_2</math>-slice triples + 6000 seeded + all 496 <math>\theta</math>-adjacent; all <math>N_{\alpha\beta} = \pm 1</math>). [E] SINGULARITY: <math>J_1^a s\rangle = 0</math> for ALL 248 basis elements (0 violations); case tally 190 (first bracket) / 57 (second) / 1 (<math>a = F^\theta</math> via the central-term cancellation — the ONLY case that sees the level <math>k</math>); plus <math>J_2^a s\rangle = 0</math> (248), <math>E_0^a s\rangle = 0</math> (120 positive roots), Shapovalov norm 0 at <math>k=1</math> (4 at <math>k=2</math>); the affine PBW engine unit-tested on all 61504 basis pairs. [E] LEVEL DIAL: the <math>F_1^\theta</math> coefficient is <math>2(1-k) - 2</math> at <math>k=0</math>, 0 EXACTLY at <math>k=1</math>, <math>-2</math> at <math>k=2</math>: without the central extension the deletion object does NOT exist. [E] <math>\mu_4</math> DATA: <math>\theta</math>-grading dims <math>(1, 56, 134, 56, 1)</math>, <math>\mathfrak{g}_0 = \mathfrak{e}_7 \oplus \mathfrak{u}(1)</math>; the <math>h</math>-adapted chamber machine-built (Cartan det 1, <math>E_8</math> Dynkin diagram, branch lengths <math>[1, 2, 4]</math>); <math>\langle \theta, h \rangle = 5 \Rightarrow j(\theta) = 1</math>, height <math>29 = h^\vee - 1</math>; <math> s\rangle</math> in class 2 (sheet-EVEN, consistent with WP5a); clock phase <math>i^2 = -1</math>; cross-table <math>\theta</math>-grading <math>\times</math> glue class consistent (rows <math>(1, 56, 126, 56, 1)</math>, columns <math>(52, 64, 60, 64)</math>); the deleting <math>\theta</math>-<math>\mathfrak{sl}_2</math> crosses the sheet-ODD classes <math>(1, 3)</math>, its square is sheet-even. [E] LEVEL-2 MATCH: <math>\text{mult}(2\theta) = 1</math> in the level-2 Fock <math>\Rightarrow U(\mathfrak{g}) s\rangle</math> is THE 27000; the direct <math>\mathfrak{g}_0</math>-orbit BFS reproduces the Freudenthal multiplicities of <math>V(2\theta)</math> EXACTLY through depth 4; quotient <math>31124 - 27000 = 4124</math>; lattice reading <math>(2\theta, 2\theta)/2 = 4 &gt; 2 \Rightarrow</math> no momentum-<math>2\theta</math> state at <math>q^2</math> in <math>E_4/\eta^8 -  s\rangle</math> IS the kernel generator of Fock <math>\rightarrow E_4/\eta^8</math>. [E] NEGATIVE CONTROLS: <math>E_{-1}^\theta 0\rangle</math> NOT singular (one witness <math>F^\theta, \rightarrow -k 0\rangle</math>) — the 248-current state that must REMAIN (<math>\chi_1 = 248</math>); 4 generic level-2 states non-singular (14–33 witnesses); <math>k</math>-dial: at <math>k=2</math> the CUBE is singular (the <math>(E^\theta)^{k+1}</math> mechanism = generic Kac level mechanics); <math>D_8/SO(16)_1</math>: the singular vector exists there TOO (level-1 generic) but the <math>h = \frac{1}{2}</math> blocks do not fuse (3 comark-1 weights, <math>\dim V(2\theta_{D_8}) = 5304 \neq 14^3</math>) vs <math>E_8</math> (comarks <math>\geq 2</math>, vacuum the ONLY level-1 primary, glue weights <math>(0, 1, 1, 1)</math> integer) — the ONE-BLOCK closure is the <math>E_8/\mu_4</math>-specific part, honestly separated from the generic singular-vector mechanics. [C] Weyl complete reducibility beyond BFS depth 4; the Kac mechanics beyond level 2; the per-period quarter dictionary (v496). [O] HONEST LIMIT: in the twisted quarter-SLOT moding of the <math>\chi_w</math> limit Fock two sector-<math>C_1</math> modes never sum to 8 quarters (minimum <math>6 = q^{3/2}</math>) — the per-PERIOD dictionary (v496), not the per-slot identification, carries <math> s\rangle</math> to <math>q^2</math>; exactly the precise WP5c question (GNS limit state, kernel <math>\supseteq</math> ideal); WP5c-e stay [O]; SEAM.EQUIV.01 stays [O], untouched. Exact (integer + Fraction). [E][C][O]</p> |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v499_p2_weights_<br>deligne_bg.py | <p>P2.TYPING.01: the P2 weight-typing postulate HARDENED (the v491 check-9 residual) — the anchor <math>a=(1,1,2)</math> typed as the Birkhoff–Grothendieck splitting exponents of the DELIGNE CANONICAL EXTENSION <math>E</math> of the flavor connection; sympy exact, no floats. Given the [E] anchors (4 marks v216, rank 3 v137, cusp class + irreducibility v117, (U)): <math>\deg E = -4</math> AS A THEOREM (cusp class <math>\Rightarrow</math> canonical residue exponents <math>\{0, \frac{1}{3}, \frac{2}{3}\}</math>, the unique lift in <math>[0,1]</math>; trace 1 per mark <math>\times</math> 4 marks; par-deg 0; <math>\infty</math> APPARENT, monodromy product = <b>1</b> exactly); POSITIVITY AS A THEOREM (irreducibility EXACT: <math> \langle U, M_0 \rangle  = 24 =  S_4 </math>, <math>\sum_g  \chi ^2 = 24</math>; with (U) <math>\Rightarrow</math> Mehta–Seshadri stability <math>\Rightarrow h^0(E) = 0</math>, all 324 section-saturation cases; BG dictionary <math>h^0 = 0 \Leftrightarrow a_i \geq 1</math>); INTEGRALITY = Birkhoff–Grothendieck, automatic once <math>E</math> is typed as a bundle. UNIQUENESS + SELECTOR: <math>\{1,1,2\}</math> unique (v491); the Schur–Horn permutohedron of <math>4 \cdot \text{spec}(A_0)</math> has integer points exactly <math>\{(2,2,0), (2,1,1)\}</math> (the two options of the “Global computation” theorem) and <math>h^0 = 0</math> kills <math>\{0,2,2\}</math> (an <math>\mathcal{O}(0)</math> summand has <math>h^0 = 1</math>) — the “balanced” selection is now TYPED as stability/positivity. THE <math>h^1</math> DISCREPANCY, REAL + RESOLVED: <math>h^1(\mathcal{O}(-2) \oplus \mathcal{O}(-1)^2) = 1 \neq 3</math> — the naive “generations = <math>H^1(E)</math>” typing is FALSE (forcing it demands <math>\deg -6</math> and loses uniqueness: <math>\{1,1,4\}, \{1,2,3\}, \{2,2,2\}, e_2</math> never 5); the correct TWO-OBJECT typing: <math>L = \mathcal{O}(-D)</math>, <math>D = \mu_4</math>, carries the generations (<math>h^1(L) = 3 = N_{\text{fam}} \cong H^0(\Omega^1(\log D))</math>, the v137 basis), while <math>E</math> carries them as its FIBER (rank 3) with the anchor as splitting type. BISWAS EXPLICIT (independent convergence witness): the weight denominator is <math>3 = N_{\text{fam}}</math>, so the Biswas cover is the <math>\mathbb{Z}_3</math> cusp cover <math>y^3 = (z-1)(z-i)(z+1)^2(z+i)^2</math>, genus 2 (NOT the pillowcase double <math>w^2 = z^4 - 1</math>, genus 1, <math>j=1728</math> — the deck side); <math>p_*\mathcal{O}_Y = \mathcal{O} \oplus \mathcal{O}(-2)^2</math> (<math>\chi</math> cross-check <math>-1 = -1</math>); the regular-representation model bundle lands on <math>\{0,2,2\}</math> = the UNSTABLE Schur–Horn companion (<math>h^0 = 1</math>): integrality AND the sum rule COME OUT of the correspondence, and stability (irreducibility, v117) is the selector. NEGATIVE CONTROLS: drop positivity <math>\rightarrow 4</math> resp. 31 solutions; <math>\deg -3/-5</math> breaks; <math>n</math>-mark scan: <math>\{1, \dots, 1, 2\}</math> unique for EVERY <math>n \geq 3</math> but <math>e_2 = (n-2)(n+1)/2 = 5</math> ONLY at <math>n=4</math> — the VALUE, not the uniqueness, is the <math>n=4</math> content; MS-rational exponents <math>e_2 = \frac{16}{3}, \frac{44}{9}</math>. [C]</p> <p>RESIDUALS: R1 the module identification “generation space = this <math>H^1</math> with this connection” [C] (QGEO.SYM territory, stays [O]); R2 unitarity (U) [C] (v33/v40); R3 the analytic-monodromy identification (fine type Numerical, v117 check 4). P2 stays an axiom (AX.P2.01 declared, no marker moves); NON-CIRCULAR: neither v23’s splitting-type input nor v115’s <math>\text{diag}(A_0) = a/4</math> input is used. Sharpens v491. Exact (sympy); Wolfram-mirrored. [E][C]</p> |

| Script                                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v500_celestial_<br>wp5c_gns_limit_<br>state.py | <p>CELEST.WP5C.01: WP5c of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — “the GNS limit state”, the third constructive milestone of WP5 (v497 made the boundary limit precise, v498 built the deleting operator; WP5c constructs the STATE whose GNS kernel contains the ideal). Exact integer/Fraction arithmetic, no floats, deterministic. [E] CONSTRUCTION: the quasi-free family <math>\omega_w</math> — loop sector (<math>r=0</math>) = the affine <math>k=1</math> vacuum <math>n</math>-point functions via the MACHINE-determined compact anti-involution <math>\theta(e_\alpha)=-e_{-\alpha}</math>, <math>\theta(h)=h</math> (the UNIQUE sign that is an anti-automorphism on ALL 61504 basis pairs; contravariance <math>\langle J_{-1}^x u, v \rangle = \langle u, J_1^{\theta x} v \rangle</math> exact); radial sector (<math>r \geq 1</math>) = oscillator pairings <math>x^{wr}</math> (the exact Gibbs regulator <math>e^{-\beta E_w}</math>, kept <math>x</math>-adic). [E]</p> <p>CONVERGENCE, SHARP: <math>\omega_w = \omega_\infty \bmod x^{N+1}</math> for ALL <math>w \geq N+1</math> (<math>N=8</math>) and NOT yet at <math>w=N</math> (the <math>r=1</math> modes sit at order <math>N</math>) — the WP5a threshold <math>w = n+1</math> holds IDENTICALLY at the state level; positivity of every <math>\omega_w</math> checked. [E] THE KERNEL (core, fully machine): the FULL exact level-2 Gram — 31124 monomials in 9361 weight blocks (dim profile 164:1, 37:240, 7:2160, 1:6960), every block exact: level-1 rank 248 POSITIVE DEFINITE (Cartan block = the <math>E_8</math> Cartan matrix, det 1); level-2 rank <b>4124</b>, kernel <b>27000</b>, every block PSD; rank per Weyl orbit (norm 8/6/4/2/0) = (0, 0, 1, 8, 44); kernel = <math>V(2\theta)</math> WEIGHT BY WEIGHT (Freudenthal cross-check on all 9361 weights); highest-weight norms (3844, 49, 2, 0) at <math>(0, \omega, \theta, 2\theta)</math>; direct ideal checks <math>F_i s\rangle</math>, <math>F_j F_i s\rangle</math> norm 0. [E]</p> <p><math>\mu_4</math>-EQUIVARIANCE: <math>\omega_w \circ \text{clock} = \omega_w</math> for ALL <math>w</math>; the clock unitary DESCENDS to <math>\text{GNS}(\omega_\infty)</math>; level-2 GNS rank split by clock class</p> <p><math>= (1036, 1024, 1040, 1024) = \Theta_{C_j}/\eta^8</math> at <math>q^2</math> (the two-routes identity at the STATE level); level-1 split (60, 64, 60, 64). RESOLUTION OF WP5b S4.10: <math> s\rangle</math> IS the ZERO VECTOR of <math>\text{GNS}(\omega_\infty)</math> — the twisted two-<math>C_1</math>-mode floor (6 quarters <math>= q^{3/2}</math>) concerns only pre-limit objects (GNS has no state there: <math>6 \bmod 4 \neq 0</math>).</p> <p>[E] NEGATIVE CONTROLS: <math>k=2</math> (<math>\langle s s \rangle = +4</math>, dominant blocks FULL rank — NO ideal in the kernel); <math>k=0</math> (level-1 Gram <math>\equiv 0</math> — no 248 layer without the central extension); <math>D_8/SO(16)_1</math> (level-2 rank 2076 = 7380 – 5304, kernel <math>= V(2\theta_{D_8})</math> PSD weight by weight, but <math>h = (0, \frac{1}{2}, 1, 1)</math>: the vacuum GNS is 1 of 4 blocks — ONE-BLOCK completeness stays <math>E_8/\mu_4</math>-specific); wrong family <math>E'_w = mw+r</math> (level-1 limit rank 0: the 248 layer ERASED, <math>u^4</math> content <math>710955 \neq 248</math>); no damping (<math>897266 \neq 248</math>); CCR OBSTRUCTION: at a FIXED radial pairing <math>c &gt; 0</math> positivity forces <math>\omega(bb^*) \geq c</math> — NO <math>w</math>-uniform damping state exists: the family formulation is NECESSARY and the family EXISTS <math>\Rightarrow</math> the preregistered KILL is probed and NOT triggered. [C] the quasi-free/Gaussian extension to the full <math>*</math>-algebra; Kac positivity beyond level 2 (levels <math>\leq 2</math> machine-checked); the module identification in the component route. [O] local normality of <math>\omega_\infty</math>, the net structure / Haag duality (WP5d), Costello–Li (WP5e), the operator-algebraic closure beyond the graded/<math>x</math>-adic topology;</p> <p>SEAM.EQUIV.01 stays [O], untouched. VERDICT: SUCCESS on the preregistered criterion (dim GNS level-2 = 4124 exactly). Exact (integer + Fraction). [E][C][O]</p> |

|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v501_celestial_<br>wp5d_two_interval_<br>index.py | <p>CELEST.WP5D.01: WP5d-<math>\alpha</math> of the celestial-holographic research contract<br/> CELEST.SEAM.01 — “the two-interval index from the lattice” (the local-net question, alpha stage). The roadmap discriminator: <math>(E_8)_1 \Rightarrow \mu=1</math> (Haag-dual two-interval net, ONE sector); <math>SO(16)_1 \Rightarrow \mu=4</math>; preregistered KILL = “the two-interval <math>\mu</math>-offset does NOT vanish after the condensation”. numpy/scipy Gaussian machinery + exact Fractions. [E] SETUP (machine identities): critical Majorana ring (v450 style, NS closure, <math>c=\frac{1}{2}</math> per layer), 16 layers = the seam carrier <math>c_-=8=g_{\text{car}}+N_{\text{fam}}</math> (v489); Peschel-exact; three prescriptions — fermionic <math>\rho</math>, orbifold sector sum <math>\{1, P_A, P_B, P_{AB}\}</math>, dual algebra <math>\{1, P_{AB}\}</math>; superselection <math>[\rho, P_{AB}]=0</math> machine-exact; EVERY Gaussian formula validated against exact diagonalisation (<math>\leq 1.5 \times 10^{-15}</math>). [E] FERMIONIC MI EXTENSIVE (the <math>\mu=1</math> reference; lattice witness): <math>I(x) = -(c/3) \ln(1-x)</math> with <math>c</math> fitted 0.5000; <math>\max  F(x)  = 5.97 \times 10^{-5}</math> at <math>N=512</math>, <math> F </math> falling monotonically to <math>1.3 \times 10^{-6}</math> at <math>N=1024</math> — Casini–Huerta extensivity on the lattice. [E] THE <math>\mu</math>-OFFSET (core): Rényi-2 exactly <math>\Delta_2 = -\ln[(1+R)/2]</math>; the 16-layer seam carrier saturates <math>\ln 2</math> to MACHINE PRECISION (<math> \Delta_2 - \ln 2  = 1.1 \times 10^{-15}</math> at <math>N=512</math>; <math>R \sim N^{-0.500}</math>); index reading <math>[F : F_{\text{even}}] = e^{\Delta_\infty} = 2.000000 \Rightarrow \mu_{\text{gauged}} = e^{2\Delta_\infty} = 4.000000 =</math> the v490 parity census (TWO independent lattice witnesses); gauging every layer separately costs <math>16 \ln 2</math> — the offset measures <math>\ln[\text{index of the subnet}]</math>, not a universal blob. [E] HAAG-DUALITY INDICATOR: fermionic <math>S(E)=S(E')</math> to <math>8.2 \times 10^{-12}</math> (graded-duality proxy); the orbifold BREAKS complementarity (<math>D(E) - D(E') = 0.427</math> at <math>a=64</math> — the direct duality-failure witness); the complementary-pair sum is exchange-symmetric and <math>\leq \ln 4 = \ln \mu(SO(16)_1)</math> with <math>\max 1.2637</math> at the self-dual <math>x=\frac{1}{2}</math> and <math>\rightarrow \ln 2</math> at the squeezed ends: the <math>\ln 4</math> KLM budget is a DOUBLE-LIMIT statement, NOT a fixed-<math>x</math> identity (the first naive fixed-<math>x</math> check was WRONG and was replaced — honestly typed). [E]<br/> CONDENSATION ARITHMETIC, LATTICE-ANCHORED:<br/> <math>\det \text{Cartan}(D_5) \cdot \det \text{Cartan}(A_3) = 4 \cdot 4 = 16 = \mu(\text{carrier})</math>; KLM/Longo–Rehren quotients <math>\mu/ L ^2</math>: <math>16/4^2 = 1</math> (one-step <math>\mu_4</math> glue) and <math>16/2^2 = 4 \rightarrow 4/2^2 = 1</math> (via <math>SO(16)_1</math>), both routes EXACT; <math>\Sigma d_i^2</math> cross-checks (Ising 4, <math>SO(16)_1</math> 4, <math>(E_8)_1</math> 1); <math>\theta_v = e^{2\pi i \nu/16} = 1</math> EXACTLY at <math>\nu = 2c_- = 16</math>, rivals <math>\nu = 1, 2, 8</math> give <math>\theta_v \neq 1</math>. The anchored chain: <math>\mu = 1</math> (graded, MEASURED) <math>\rightarrow 4</math> (gauged, MEASURED + v490 census) <math>\rightarrow 1</math> (arithmetic, [C]: the condensed net is interacting — the v490 fence). [E] NEGATIVE CONTROLS: <math>\nu=1</math> single Majorana (offset non-trivial, <math>\Delta_2 = 0.6364</math> at <math>N=2048</math> rising, and <math>\theta_v = e^{i\pi/8} \neq 1</math>: NOT removable — the kill discriminator has teeth); trivial dimerised phase (everything <math>\leq 10^{-7}</math>); wrong sector sum <math>\{1, P_{AB}\}</math> (offset EXACTLY 0 instead of <math>\ln 2</math>). [C] the continuum dictionary “offset = <math>\ln</math> index” (KLM two-interval index; Longo–Xu; Casini–Huerta–Magan–Pontello entropic order parameters) + the <math>\theta_v=1</math> condensation step itself. [O] continuum Haag duality, local normality, split/strong additivity of the quotient net (WP5d-<math>\beta</math>, running as exploration), Costello–Li (WP5e); SEAM.EQUIV.01 stays [O], untouched. VERDICT: the <math>\mu=1</math> indicator chain PASSES; the preregistered KILL is NOT triggered. Python (numpy + scipy + Fractions). [E][C][O]</p> |

| v502_celestial_<br>wp5e_prefactor_<br>level.py | <p>CELEST.WP5E.ALPHA.01: WP5e-<math>\alpha</math> of the celestial-holographic research contract CELEST.SEAM.01 — “prefactor and level bookkeeping”, the CFT-side anchor stage of WP5e (the BCOV/Costello–Li twistor uplift: boundary partition function <math>= E_4/\eta^8</math> including the <math>q^{-1/3}</math> prefactor; preregistered kill: the anomaly inflow demands a level <math>\neq 1</math>). Exact sympy/Fraction. [E] PART A — the <math>q^{-1/3}</math> prefactor is exact <math>\mu_4</math> vacuum-energy bookkeeping; Hurwitz-<math>\zeta</math> derivation (<math>\zeta(-1, \theta) = -B_2(\theta)/2</math>; <math>E_b(\theta) = -\frac{1}{24} + \theta(1 - \theta)/4</math> exactly); the clock is INNER (<math>h = (2, 2, 2, 2, 2; 0^4)</math> and the <math>A_3</math> detector <math>h' = (0^5; 1, 1, 1, -3)</math> both read the class mod 4 on all 240 roots; <math>(h, h) = 20</math>, <math>(h', h') = 12</math>, sum 32) <math>\Rightarrow</math> twist distribution <math>\theta = 0^8</math> in ALL four sectors — a SHIFT orbifold (lattice cosets, integer-moded oscillators), <i>not</i> a rotation orbifold; <math>E_{\text{osc}} = -\frac{1}{3} = -c/24</math> sector-independent (<math>c = 8 = \text{rank} = 248/31</math>); sector ground exponents <math>-\frac{1}{3} + (0, 1, 1, 1)</math>. [E] discriminant form = Casimir energy, TWO routes: spectral flow <math>j^2(h, h)/32</math> (<math>5j^2/8, 3j^2/8</math>, sum <math>j^2 \equiv 0 \pmod{1}</math> = the isotropy/Lagrangian condition) and <i>exactly</i> via free fermions (<math>D_5 = 10</math> Majorana, <math>A_3 = D_3 = 6</math>, glue diagonal <math>= 16 = 2^{g_{\text{car}}-1}</math>, the WP5d seam carrier; R–NS shift <math>n/16</math>: <math>\frac{5}{8}, \frac{3}{8}, 1</math>); the ROTATION reading fails (the geometric <math>A_3</math> deck gives <math>\frac{3}{16} \neq \frac{3}{8}</math>: the v492 “clock <math>\neq</math> deck” lesson at the Casimir level). [E] character: <math>\sum_j \Theta_{C_j} = E_4</math> and the four sector characters (leading coefficients <math>(1, 64, 60, 64)</math>, currents <math>(60, 64, 60, 64)</math>) sum exactly to <math>E_4/\eta^8 = q^{-1/3}(1, 248, 4124, 34752)</math>. [E] PART B — <math>k = 1</math> forced THREE independent ways: (i) the CURRENT condition <math>h(J) = k = 1</math> (the <math>\mathbb{Z}_4</math> extension closes onto the <math>E_8</math> adjoint <math>60+64+60+64 = 248</math> only at spin 1); HONEST SHARPENING: glue-<math>h</math> integrality <math>h(J^j; k) = k(0, 1, 1, 1)</math> holds for ALL <math>k = 1..8</math> — the originally conjectured integrality route fixes <i>nothing</i>, the three other dials carry; (ii) conformal embedding <math>47k^2 + 219k - 266 = 47(k-1)(k+266/47) = 0</math> resp. <math>D_8</math>-in-<math>E_8</math>: <math>128k(1-k) = 0</math>; (iii) central charge <math>248k/(k+30) = 8 \Leftrightarrow 240(k-1) = 0</math> (= the prefactor itself); plus the v498 singular-vector dial (<math>\ (E_{-1}^\theta)^m 0\ ^2 = m! k(k-1) \cdots (k-m+1)</math>, singular vector exactly at grade <math>k+1</math>; <math>k = 1</math> deletes <math>V(2\theta)</math>: <math>31124 - 27000 = 4124</math>). [E] negative controls: <math>D_8/SO(16)_1</math> (same rank, same <math>c = 8</math>, SAME <math>q^{-1/3}</math> prefactor, but <math>h = (0, \frac{1}{2}, 1, 1)</math>: the discriminator is glue-<math>h</math> integrality, not the prefactor; <math>\Theta_{D_8} + \Theta_s = E_4</math>); <math>\mathbb{Z}_2</math> rotation (<math>E = +\frac{1}{6}</math>, <math>h = \frac{1}{2}</math>: no <math>\mu_4</math>-shift sector there); <math>\mu_4</math> rotation (sector-dependent <math>(-\frac{1}{3}, \frac{1}{24}, \frac{1}{6}, \frac{1}{24})</math>: the common prefactor breaks); wrong <math>k \in \{2, 3, 4\}</math> fails all five dials coherently (residuals <math>360/814/1362</math>; <math>\langle s s \rangle = 4/12/24</math>; level-2 dim stays <math>31124 \neq 4124</math>). [C] Kac generation of the maximal submodule by the grade-<math>(k+1)</math> singular vector for <math>k \geq 3</math> (<math>k = 1, 2</math> machine-anchored by WP5b/WP5c). [O] the BCOV/Costello–Li twistor inflow itself (Costello’s one-loop axion <math>\lambda_g/(8\pi\sqrt{3})</math> on <math>\mathbb{P}^1</math>, the Costello–Paquette–Sharma level-from-flux mechanism) stays open — v502 anchors the CFT side of WP5e only (<math>\alpha</math> stage); the kill branch (“inflow demands a level <math>\neq 1</math>”) is not triggered on the CFT side but its twistor side is untested; WP5e stays [O]; SEAM.EQUIV.01 untouched, no marker moves. Exact (sympy + Fraction). [E][C][O]</p> |

|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v503_qgeo_<br>emergence_light.py | <p>QGEO.EMERGE.LIGHT.01: the v215 <i>deferred emergence test</i> (lever 7) executed in its first honest LIGHT version, plus the residual-convergence result QGEO-R1 <math>\equiv</math> P2-R1 (analysis/kill-test class; NO marker moves — QGEO.REALIZE.01 stays [C]/[O]). NO DYNAMICAL SELECTION (<math>\zeta</math>-log-det via the Dedekind-<math>\eta</math> formula, mpmath 40 digits): <math>\log F = \log(\tau_2 \eta ^4)</math> is exactly <math>S</math>-invariant, so <math>t = 1</math> is automatically critical on the rectangular family <math>\tau = it</math>; there a strict local maximum (<math>g''(1) = -1.298</math>) but a <i>minimum</i> in the <math>\tau_1</math>-direction (<math>h''(0) = +0.298</math>): <math>\tau = i</math> is a SADDLE of the full moduli space; critical points = the CM points (<math>E_2^*(i) = E_2^*(\rho) = 0</math> to 40 digits); the <i>global</i> det' winner at fixed area is the HEXAGONAL torus (<math>\log F(\rho) = -1.03352 &gt; \log F(i) = -1.05469</math>; Osgood–Phillips–Sarnak 1988) — free-field dynamics alone does <i>not</i> select <math>\tau = i</math>; criticality at the square is Palais symmetric criticality (the independent heat trace is equally critical). SHARP RIGIDITY (v280 lattice DtN): the mod-4 off-character indicator (the v215-K3 lever as a <i>modulus function</i>) has an isolated zero (<math>8 \times 10^{-15}</math>) exactly at <math>\tau = i</math>, strictly monotone in both directions (min <math>8.4 \times 10^{-2}</math> away); <math>R^2 = \mathbb{Z}_2</math> exactly as permutation matrices (the v492 <math>\mathbb{Z}_8</math> bridge on the lattice); <math>j(it) \geq 1728</math> with equality only at <math>t = 1</math>, <math>j(\rho) = 0</math>. [E] the <math>\mathbb{Z}_2</math> chain is MODULUS-BLIND: 4 fixed points and <math>[\mathbb{Z}_2, \Delta_t] = 0</math> on <i>every</i> torus (v216 confirmed without mark input); pillowcase det' = <math>\frac{1}{2}</math> torus det' exactly (<math>\pm</math>-pair structure), so all <math>\tau</math> conclusions transfer verbatim; marks/mark-locality/deck<sup>2</sup> exist on <i>every</i> pillowcase (v264/v280), only the order-4 clock distinguishes <math>\tau = i</math>; <math>\text{Aut}(E_\rho) = \mathbb{Z}_6</math> (element orders 1, 2, 3, 6) contains <i>no</i> order-4 element — dynamics and clock are logically independent selectors; GIVEN the clock, <math>P(iZ) = P(Z)</math> forces <math>a_3 = a_2 = a_1 = 0</math> and <math>j = 1728</math> identically (v493): the modulus is not a second input. [C]/[O] RESIDUAL CONVERGENCE (the core finding): the order-4 element on <math>H^1</math> is a Coxeter element of <math>W(A_3)</math> (char poly <math>\lambda^3 + \lambda^2 + \lambda + 1</math>, order <math>h(A_3) = 4 =  \mu_4  = N_{\text{fam}} + 1</math>) — exactly the P2 cusp-class/carrier datum of the P2 hardening (v499 R1) <math>\Rightarrow</math> QGEO-R1 <math>\equiv</math> P2-R1: ONE common residual, “why does the raw seam carry the order-4 clock”, not two scattered ones; chain: marks derived (v216 [E]), square derived <i>given</i> the clock (v493 [E]), clock = carrier input [C], rest = the dynamical realisation of the clock [O]; route classification (v347 analogue): B-rigidity in the sharpened form “RP seam data <math>\Rightarrow</math> order-4 clock” is the live route — free dynamics alone does not deliver the clock (the hexagonal finding). Lever update (documented here, v215 itself unchanged): lever 7 lifted from “deferred, not executable” to “light version executed: rigidity, not dynamical selection”. Python (mpmath + numpy/scipy + sympy). [E][C][O]</p> |

| v504_celestial_<br>wp5d_klm_<br>completeness.py | <p>CELEST.WP5DB.01: WP5d-<math>\beta</math> of the celestial-holographic research contract<br/> CELEST.SEAM.01 — “split + strong additivity from the lattice”, the two<br/> remaining Kawahigashi–Longo–Müger legs of complete rationality (the <math>\mu</math>-index is<br/> v501), witnessed for the orbifold prescription on the critical Majorana seam edge;<br/> the <math>U(1)</math>/Dirac subnet is the preregistered negative control (the current net,<br/> where strong additivity fails in the continuum). [E] STRONG ADDITIVITY,<br/> EXACT: shared boundary Majorana <math>\Rightarrow</math> Even(<math>A</math>) <math>\vee</math> Even(<math>B</math>) = Even(<math>A \cup B</math>)<br/> EXACTLY (GF2 spans full 64/64 up to 1024/1024; matrix rank 32/32);<br/> DISJOINT: exactly HALF (rank 16/32, index 2 — the missing odd <math>\otimes</math> odd sector is<br/> the v501 ln 2 bit, localised at the split point); the neutral <math>U(1)</math> algebras do NOT<br/> generate the union even with the shared site (gaps 2/10/52, growing). [E]<br/> ENTROPIC WITNESS [N]: the fermionic touching MI carries the pure UV<br/> point-gap law <math>((c/3) \ln 2</math> increments, dev <math>1.2 \times 10^{-6}</math> — no discriminator); the<br/> honest discriminator is BOUNDED vs DIVERGENT: the <math>\mathbb{Z}_2</math>/orbifold deficit stays<br/> <math>&lt; \ln 2</math> with <math>(\ln 2 - \Delta_2) \sim N^{-p}</math>, <math>p = 0.2444</math> vs <math>2\Delta_\mu = \frac{1}{4}</math> (Ising disorder dimension;<br/> “defect <math>\rightarrow 0</math>” would be FALSE at the sharp split — bounded <math>\Leftrightarrow</math> finite index,<br/> Longo–Xu), while the <math>U(1)</math> control BURSTS ln 2 from <math>L = 128</math> and grows as<br/> <math>\frac{1}{2} \ln \text{Var } Q_A</math> (Klich–Levitov 0.10134 vs <math>1/\pi^2</math>): infinite index. [E]<br/> SPLIT/NUCLEARITY [N]: coupling <math>\sigma_k</math> fall at the elliptic-nome rate<br/> <math>\pi K(1-x)/K(x)</math> to 1.3–2.0%; <math>\sigma_1 \sim x^{0.5044}</math>; trace norm summable; ORBIFOLD<br/> INHERITANCE EXACT: <math>P_A</math> flips <math>C \rightarrow -C</math> (<math>\sigma_k</math> identical, <math>8.3 \times 10^{-17}</math>), the<br/> even-bilinear Gram is the compound <math>\Lambda^2 C</math> (<math>\{\sigma_a \sigma_b\}</math>, <math>2.8 \times 10^{-14}</math>) — Longo heredity<br/> [C]. [E] PIMSNER–POPA: <math>E(a) - a/2 = PaP/2</math> IDENTICALLY <math>\Rightarrow</math><br/> <math>\lambda = \frac{1}{2} = 1/[F : F_{\text{even}}]</math>; integer attainment (16384 + 2048 monomial sweeps, 0<br/> violations; pencil min <math>\lambda = 0.5000000000</math>); <math>\lambda_{E_4} = \frac{1}{4} = 1/\mu</math> exactly; INDEX<br/> CONSISTENCY, two routes: <math>e^{\Delta_\infty} = 2.0000000000 = 1/\lambda_{\text{PP}}</math> and <math>e^{2\Delta_\infty} = 4 = \mu</math>;<br/> <math>U(1)</math>: <math>\lambda = 1/(m+1) \rightarrow 0</math>. [E] CONTROLS + HONESTY: dimerised phase trivial<br/> (<math>3.6 \times 10^{-15}</math>); wrong prescription <math>\{1, P_{AB}\}</math> deficit EXACTLY 0; finite-size honesty<br/> (14.9% below ln 2 at <math>N = 4096</math> — witness, not proof). [C] the KLM dictionary<br/> (Longo–Xu; Longo heredity; CHMP). [O] the continuum theorem “finite-group<br/> orbifolds of completely rational nets are completely rational” is XU’S THEOREM<br/> — CITED, NOT CLAIMED; the seam quotient net and the condensed <math>(E_8)_1</math> net<br/> stay WP5e/Costello–Li; SEAM.EQUIV.01 stays [O]. VERDICT: with v501, all<br/> THREE KLM ingredients witnessed on the lattice. Python (numpy + scipy);<br/> exact parts Wolfram-mirrored. [E][C][O]</p> |

| v505_celestial_<br>wp5e_beta_<br>equivariant_<br>ledger.py | <p>CELEST.WP5E.BETA.01: WP5e-<math>\beta</math> of the celestial-holographic research contract CELEST.SEAM.01 — “the equivariant anomaly ledger on twistor space”, the twistor-side milestone of WP5e (the BCOV/Costello–Li uplift; preregistered kill: the anomaly inflow demands a level <math>\neq 1</math>); WP5e-<math>\alpha</math> (v502) anchored the CFT side. The Atiyah–Bott/Lefschetz fixed-point skeleton of the one-loop box anomaly (Costello; Bittleston–Sharma–Skinner) evaluated exactly on <math>\mathbb{C}^2/\mathbb{Z}_4</math> with the <math>E_8</math> <math>\mu_4</math>-glue monodromy. Exact sympy/Fraction. [E] AB ledger: denominators <math>\det(1 - g_j^{-1}) = (2, 4, 2)</math>; <math>\sum_j 1/\det_j = 5/4 = ( \mathbb{Z}_4 ^2 - 1)/12</math> (Dedekind); equivariant characters <math>\mathrm{tr}_{g_j}(\mathrm{Ad} E_8) = (248, 0, -8, 0)</math> by two routes; invariant average <math>60 =</math> the <math>D_5 + A_3</math> carrier; Frobenius 61568; <math>\mathrm{tr}_{g_2} = -8 = 120 - 128</math>. [E] Okubo per sector (honest sharpening): the invariant sector is exactly Okubo-quadratic (<math>Q^{(0)} = 36\langle x, x \rangle^2</math>, <math>36 = \tilde{\lambda}_{e_8}^2</math> — v495 re-derived through the glue grading); the twisted sectors do NOT reduce (<math>T_5: (-8, 32, -8)</math>, <math>T_3: (48, -64, 48)</math>); the AB-weighted sum cancels the <math>D_5</math> quartic exactly and leaves the RIGID residual <math>32T_3</math>; the only quartic-free weighting is the uniform <math>\mathbb{Z}_4</math> projector; the graded GS exchange is exactly rank-obstructed in sectors 1, 2, 3; heterotic identities exact (<math>\mathrm{Tr}_{120}, \mathrm{Tr}_{128}, \mathrm{Tr}_{E_8} = 9(\mathrm{tr}^2)^2</math>). [E] index bridge (centrepiece): <math>f(m) = \frac{1}{4} \sum_j (i^{jm} - 1)/\det_j = (0, -\frac{3}{8}, -\frac{1}{2}, -\frac{3}{8}) = \mathrm{ch}_2(T_m) = -(C^{-1})_{mm}/2</math> EXACTLY — fixed-point ledger = McKay/Kronheimer intersection ledger; glue <math>\mathrm{ch}_2</math> defect <math>-78</math> by both routes (classes <math>(-24, -30, -24)</math>; <math>-30 = -h^\vee</math>, a [C] coincidence); <math>\sum_m h_{A_3}(m) = 5/4 = \sum_j 1/\det_j</math>; Killing sums <math>(320, 320, 240, 320)</math>, total <math>1200 = 2h^\vee(h, h)</math>. [E] <math>k = 1</math> geometric: lattice current count = 240 at <math>k = 1</math>, exactly 0 at <math>k = 2, 3, 4</math>; embedding residual <math>47k^2 + 219k - 266 = (0, 360, 814, 1362)</math>; <math>h(J; k) = k</math> integer for all <math>k</math> — integrality alone fixes nothing (honest, as v502); one scale <math>\Rightarrow</math> one level (v493 periods). [E] E3 REFUTED (prominent): <math>a_0 \in O(8)</math> fills the GRAVITON slot <math>O(2)</math>, not the BSS axion slot <math>O(-2)</math> (<math>X = -2 \neq +2 = Y</math>; mismatch <math>4 =  \mu_4 </math>, a [C] coincidence) — “the theory brings its GS axion as <math>a_0</math>” is refuted; instead the three <math>H^2(\mathrm{ALE})</math> classes carry exactly the Coxeter eigencharacters <math>\{i, -1, -i\} =</math> the three twisted slots (bijection); slot count <math>1 + 3 = 4 =  \mu_4 </math> soft. [E] negative controls: <math>\mathrm{diag}(i, i)</math> breaks four ways (<math>\sum 1/\det = \frac{1}{4}</math>, <math>\omega</math>-weight <math>-1</math>, 5 generators); <math>SO(16)</math> glue: characters <math>(120, 0, +120, 0)</math>, defect <math>-30 \neq -78</math>, bulk Okubo fails (independent quartic Casimir); <math>k = 2</math>: count 0, prefactor <math>-31/48 \neq -\frac{1}{3}</math>. [C] dictionaries <math>(\mathrm{CS}(\rho) \bmod 1 = \text{discriminant weight}; 32 = (h, h) + (h', h'); -30 = -h^\vee; \Omega\text{-contraction})</math>. [O] the global BCOV/Kodaira–Spencer quantisation on <math>\mathbb{PT}/\mathbb{Z}_4</math>, the <math>O(-2)</math> bulk-axion construction, CPS level-from-flux, the pairing of the <math>32T_3</math> residual with the three sphere axions. Verdict B; the kill branch does NOT fire on the equivariant skeleton; SEAM.EQUIV.01 untouched, no marker moves. Exact (sympy + Fraction). [E][C][O]</p> |

|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v506_seam_clock_rigidity.py | <p>SEAM.CLOCK.RIGIDITY.01: clock rigidity, Route B of the v503 classification — two exact theorems reducing the order-4 clock input to ONE alignment bit (Part A Moebius + Part B Fock in one module; QGEO.REALIZE.01 stays [C]/[O], no marker moves). Exact sympy + exact Cl(16) Fractions. [E] THEOREM A (Moebius): the collar deck <math>z \mapsto -z</math> has in <math>\mathrm{PGL}_2(\mathbb{C})</math> exactly TWO square roots (<math>z \mapsto \pm iz</math>), both automatically of order 4 (complete case analysis: <math>\mathrm{tr} \neq 0 \Rightarrow</math> diagonal <math>\Rightarrow a/d = \pm i</math>; <math>\mathrm{tr} = 0</math> impossible) — “order 4” is no longer an input; a marks-preserving root exists <math>\iff</math> the deck is the CENTRAL involution of the mark-<math>D_4</math> (center = {id, deck}, exactly 2 order-4 elements = the clocks) <math>\Rightarrow</math> then marks = one <math>\mu_4</math> orbit, cross-ratio class <math>\{2, \frac{1}{2}, -1\}</math>, <math>j = 1728</math>, <math>\tau = i</math>, free 4-cycle, deck = clock<sup>2</sup>, only the scale free; COUNTEREXAMPLE: <math>\{\pm 1, \pm(3+2\sqrt{2})\}</math> is deck-free AND harmonic with full <math>D_4</math>, but the deck is non-central (edge involution) <math>\Rightarrow 0</math> roots — harmonicity alone is NOT sufficient; the RP filter selects nothing (<math>\mathrm{Aut}(\mathbb{Z}_4)</math> ambiguity irreducible, consistent with v492). [E] B3/B4: free orbit <math>\Rightarrow n \mid 4</math>; mark transitivity <math>\Rightarrow n = 4</math>; faithfulness kills <math>n \geq 5</math>; <math>n = 3</math> fixes a mark; <math>n = 6</math> dies at cusp degree 3 (v117); the deck is modulus-blind (v503 B5 exact); controls: <math>n = 8</math> impossible; hexagonal <math>A_4</math> (0 order-4 elements, squares only <math>\{1, 3\}</math>); generic <math>V_4</math> (exponent 2); stabiliser trichotomy <math>V_4/D_4/A_4</math> with order-4 counts (0, 2, 0). [E] THEOREM B (Fock, the core result): the unique <math>S^2</math> spin structure gives NS on every circle (established P1 datum); one-particle <math>D^2 = -1</math> (charpoly <math>(\lambda^2+1)^8</math>), quarter-shift <math>C^2 = D</math>, <math>C^8 = 1</math> (charpoly <math>(\lambda^4+1)^4</math>); Fock: <math>\tilde{U} = \prod_j (1 - \gamma_j \gamma_{j+8})</math>, <math>\tilde{U}^2 = 256 \gamma_1 \cdots \gamma_{16} \Rightarrow U^2 = (-1)^F</math> EXACTLY, and <math>(cU)^2 = c^2(-1)^F</math> is never 1 (center of Cl(16) = scalars) — the <math>\mathbb{Z}_4</math> lift is FORCED (nonsplit extension); <math>\mathbb{Z}_8</math> tower: <math>V^2 \propto \tilde{U}</math>, <math>V^4 \propto (-1)^F</math>, projective order <math>8 = 2 \mu_4 </math> — fermionically explained; R control <math>U_R^2 = +1</math> (split — the forcing rests on NS = established geometry); 16-fold way <math>\theta_\nu = 1</math> at <math>\nu = 16</math>; the forcing already holds at 8 sites. [C] THE ONE REST: “the collar deck is the central involution of the mark-<math>D_4</math>” (<math>\iff</math> square-root existence on the mark data) — ONE alignment bit; the fermionic <math>\mathbb{Z}_4</math> forces the ORDER, not the spatial alignment. No overclaim. Exact (sympy + Cl(16) Fractions). [E][C]</p> |

| v507_seam_bit_origin.py | <p>SEAM.BIT.ORIGIN.01: the tautology attack on the v506 alignment bit, executed and refuted — where do the marks AND the deck come from, and does their common origin force the central alignment? (Part A torus origin + Part B fermion dichotomy in one module; NO marker moves — the bit stays [C], SEAM.CLOCK.RIGIDITY.01 and QGEO.REALIZE.01 text-precised only.) Exact sympy + exact Cl(16) Fractions. [E] ORIGIN THEOREM: the 4 marks are the fixed points of the hyperelliptic involution <math>w \mapsto -w</math> on <math>\mathbb{C}/(\mathbb{Z} + \tau\mathbb{Z}) =</math> the four half-periods <math>\Lambda/2\Lambda</math>; a translation <math>t_c</math> descends to the base sphere iff <math>2c \in \Lambda</math> — exactly the THREE half-period translations (control <math>c = 1/3</math> fails); the descended maps are the EXPLICIT rational involutions <math>\sigma_i(x) = e_i + (e_i - e_j)(e_i - e_k)/(x - e_i)</math> with the exact curve-lift identity <math>\prod(\sigma_i - e_l) = \psi_i^2 \prod(x - e_l)</math>, <math>\psi_i</math> RATIONAL; <math>\{\text{id}, \sigma_1, \sigma_2, \sigma_3\} =</math> Klein <math>V_4</math>; CONVERSELY, in ALL three stabiliser types the freely-acting involutions are EXACTLY the three <math>\sigma_c</math> (generic <math>V_4</math> (4, 3, 3), harmonic <math>D_4</math> (8, 5, 3), hexagonal <math>A_4</math> (12, 3, 3)) <math>\Rightarrow</math> EVERY mark-free collar deck (v216) IS a half-period translation — the CLASS of the deck is forced, its POSITION is not. [E] CORE SOLVE (symbolic <math>\lambda</math>): <math>\sigma_c</math> admits a marks-preserving <math>\text{PGL}_2</math> square root <math>\iff \lambda \in \{-1\}(\sigma_1), \{2\}(\sigma_2), \{\frac{1}{2}\}(\sigma_3)</math> — per half-period exactly ONE solution; intrinsically: the two deck pairs separate each other HARMONICALLY (pair cross-ratio = <math>-1</math>); union over <math>c =</math> the harmonic orbit <math>\{-1, 2, \frac{1}{2}\} \iff j = 1728 \iff \tau = i</math>; generic modulus: <math>V_4</math> abelian, ALL <math>\sigma_c</math> central and yet clockless (“central alone is empty” — the bit is the CONJUNCTION <math>D_4</math> AND central); at <math>\tau = i</math> the stabiliser jumps to <math>D_4</math> with <math>\sigma_1</math> central (2 roots = the clock pair) and <math>\sigma_2/\sigma_3</math> edge-type (0 roots); the v506 seam deck <math>z \mapsto -z</math> lands on the central <math>\sigma_1 = -1/x</math> under ALL 8 mark bijections; CM DICTIONARY: mult-by-<math>i</math> fixes exactly ONE nonzero half-period <math>c^* = (1 + \tau)/2</math> (mult-by-<math>\rho</math> 3-cycles all three); the clock lift needs the CM unit <math>i</math> (<math>\psi = 2i/(x + 1)^2</math>, <math>t^2 + 1</math> irreducible over <math>\mathbb{Q}</math>) while half-period decks lift RATIONALLY: the clock root exists only WITH CM by <math>\mathbb{Z}[i] \iff \tau = i</math>. [E] EQUIVALENCE TETRAD + CIRCULARITY AUDIT: clock exists <math>\iff (\tau = i</math> AND deck = the CM-fixed half-period) <math>\iff (\text{Stab} = D_4</math> AND deck central) <math>\iff</math> deck pairs harmonic <math>\iff</math> the NS Fock lift is NONSPLIT; the v493 converse independently re-verified — two converses of ONE equivalence, no circularity. [E] FERMION DICHOTOMY (the new physical face): central arrangement (shift by 8): <math>\tilde{U}^2 = 256 \gamma_1 \cdots \gamma_{16} \Rightarrow U^2 = (-1)^F</math>, nonsplit <math>\mathbb{Z}_4</math>, 2 roots in the 32-element dihedral lift (the <math>\mathbb{Z}_8</math> tower); edge arrangement (reflection <math>j \mapsto 4 - j</math>, fixed sites = non-marks = the silver <math>\{0, \infty\}</math>): the implementer EXISTS but <math>\tilde{U}_e^2 = +2^7 \cdot \mathbf{1} \Rightarrow U^2 = +1</math>, the extension SPLITS, 0 roots, no <math>\mathbb{Z}_8</math>; one-particle <math>(\lambda^2 + 1)^8</math> vs <math>(\lambda^2 - 1)^8</math>; census: all 28 shift-invariant 4-sets cross, all 21 reflection-invariant do not; robust at 8 sites — the bit IS a physical extension class (Fidkowski–Kitaev-type), distinguished but not derived. [E] SILVER PLACEMENT: <math>\{\pm 1, \pm(3 + 2\sqrt{2})\} =</math> “<math>\tau = i</math> with deck = a non-CM-fixed half-period translation” (all 8 bijections <math>\rightarrow \sigma_2/\sigma_3</math>, never <math>\sigma_1</math>) — in-family witness against the tautology. [C] THE REST: the one alignment bit remains a carrier datum; no tautology — the origin forces the CLASS of the deck, not its POSITION. Exact (sympy + Cl(16) Fractions). [E][C]</p> |

| v508_celestial_<br>wp5e_gamma_<br>pairing.py | <p>CELEST.WP5E.GAMMA.01: WP5e-<math>\gamma</math> of the celestial-holographic research contract</p> <p>CELEST.SEAM.01 — “the sphere-axion pairing check”, an honest rigid NEGATIVE result: can the three twisted sphere axions <math>\eta_m</math> (Coxeter eigencharacters <math>\{i, -1, -i\}</math> on <math>H^2(\text{ALE})</math>, v505 S5.8) cancel the rigid <math>32 T_3</math> residual of the Atiyah–Bott ledger (<math>A_{\text{fix}} = 9P_1 - 30P_2 - 15P_3 + 32T_3</math>, v505) by Green–Schwarz-type EXCHANGE with sector-compatible quadratic vertices? NO, with certificate. Exact sympy/Fraction. [E] VERTEX-SPACE THEOREM: the <math>W(D_5) \times W(A_3)</math>-invariant quadratics on the 8-dim glue Cartan are EXACTLY <math>\text{span}\{s_5, s_3\}</math> (dim 2, bidegree dims (1, 0, 1)), the quartics EXACTLY <math>\text{span}\{P_1, P_2, P_3, T_5, T_3\}</math> (dim 5, bidegree dims (2, 0, 1, 0, 2)) — Weyl nullspace arithmetic over all bidegrees, basis COMPLETE; PRODUCT THEOREM (the master kill): <math>(as_5 + bs_3)(cs_5 + ds_3) = acP_1 + (ad + bc)P_2 + bdP_3</math> identically — zero <math>T_5/T_3</math> content, so EVERY exchange image (any axion count, any selection rule, any couplings) is annihilated by <math>\Phi_{T_3}</math>, while <math>\Phi_{T_3}(A_{\text{fix}}) = 32 \neq 0</math>. [E] SELECTION ENUMERATION: the strict two-index reading COLLAPSES (<math>C_{j,j'} \neq 0</math> only for <math>j' = -j</math>, so the rule forces <math>m = 0</math> — the sphere axions have NO invariant bilinear Cartan vertex at all); twist insertion: <math>\eta_1 \leftrightarrow K^{(3)}</math>, <math>\eta_2 \leftrightarrow K^{(2)}</math>, <math>\eta_3 \leftrightarrow K^{(1)}</math>, <math>\eta_0 \leftrightarrow K^{(0)}</math>; channels <math>E_{13} = (16, -96, 144, 0, 0)</math>, <math>E_{22} = (16, 32, 16, 0, 0)</math>, <math>E_{00} = 225 E_{22}</math>; SIDE DISCOVERY: <math>K^{(0)} = -15 K^{(2)}</math> (the even-sector quadratics are PARALLEL). [E] UNSOLVABILITY WITH CERTIFICATE (the core result): exchange matrix <math>5 \times 2</math>, rank 2, kernel 0; <math>\text{rank}([M   A_{\text{fix}}]) = 3</math>; annihilator certificate <math>(\Phi_{T_5}, \Phi_{T_3}, \Phi_P)(A_{\text{fix}}) = (0, 32, 72)</math> with <math>A_{\text{fix}} = (9, -30, -15, 0, 32)</math> — two independent obstructions (<math>32 T_3</math> structural, rule-independent + <math>\Phi_P = 72</math> rule-driven via the <math>K^{(0)} \parallel K^{(2)}</math> collapse); <math>\ker M = 0</math> forces the unique non-disturbing coupling <math>c = 0</math>: the sphere axions are RIGIDLY SILENT in the exchange ansatz; <math>\Phi_P(Q^{(0)}) = 0</math> (the v505 sector-0 mechanism undisturbed); relaxed control: dropping charge conservation reaches the <math>P</math>-block (<math>\det = -64</math>) but <math>T_5 = T_3 = 0</math> persists. [E] NATURALNESS RESOLUTION: <math>\text{ch}_2</math>-natural <math>(9/64, 1/4)</math> and AB-weight <math>(1/2, 1/4)</math> couplings both carry certificate <math>(0, 0)</math> vs required <math>(32, 72)</math> — the failure is scale- and coupling-INDEPENDENT (no “unnatural factor”: the ansatz space misses the target identically). [E] NEGATIVE CONTROLS: invariant axion only = v505 replication + sharpening; flipped rule <math>m+j-j'</math>: the <math>\Phi_{T_3}</math> kill is flip-invariant, <math>\Phi_P</math> is rule-dependent; <math>SO(16)</math>: odd classes EMPTY and the AB sum <math>(15, -18, -15, -4, 40)</math> does not even cancel <math>T_5</math> (<math>E_8</math> doubly special); <math>D_8</math>: <math>16 T_8 + 12 s_8^2</math>, no <math>T_3</math> structure — the question cannot even be posed. [C] number fences: <math>32 = (h, h) + (h', h') = 20 + 12</math>; <math>72 = 2\tilde{\lambda}_{e_8}^2</math>. [O] SHARPENED FENCE: the exchange sub-branch is DEAD; the <math>32 T_3</math> residual MUST be carried by twisted BCOV contact terms — binary criterion WP5e-<math>\delta_1</math>: the one-loop coefficient on <math>\mathbb{C}^2/\mathbb{Z}_4</math> must come out exactly <math>(9, -30, -15, 0, 32)</math>, COMPUTED, not fitted; named escape WP5e-<math>\delta_2</math>: the full-tensor ledger (the collapse is Cartan-restricted); slot bijection (v505 S5.8) untouched; the preregistered level-kill still does NOT fire; SEAM.EQUIV.01 stays [O], no marker moves. Exact (sympy + Fraction). [E][C][O]</p> |

|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v509_celestial_<br>wp5e_eps2_level_<br>from_flux.py | <p>CELEST.WP5E.EPS2.01: WP5e-<math>\varepsilon_2</math> of the celestial-holographic research contract CELEST.SEAM.01 — “the CPS level-from-flux dial”, executed (verdict B): derive the boundary level <math>k = 1</math> from flux quantisation on the lockstep spheres, following the Costello–Paquette–Sharma (CPS) Burns-holography mechanism (PRL <b>130</b>, 061602; arXiv:2306.00940). Exact sympy/Fraction, no floats. [E] CPS SKELETON REPLICATED EXACTLY: the <math>S^3</math> period <math>\int \Omega_N = (2\pi i)^2 N</math> (pullback density <math>-\sin 2\theta</math>, their eq. 3.33); the exceptional-sphere Kähler flux <math>\int_{\mathbb{P}^1} \omega = 2\pi N</math>; the boundary level magnitude <math>2N</math> via the symplectic-boson double contraction (<math>N = 1, 2, 3</math>), Dynkin normalisation <math>T(\text{vector}) = 1</math> — “level = flux quantum <math>\times</math> Dynkin index”. [E] PAIRING MATRIX PINNED, NOT POSTULATED: the v505 <math>\text{ch}_2</math> ledger + integrality + unimodularity + effectivity pin <math>P_{mi} = c_1(T_m) \cdot [\Sigma_i] = \delta_{mi}</math> by COMPLETE enumeration (row candidates <math>8/6/8</math>; 48 unimodular solutions of <math>PC^{-1}P^T = C^{-1}</math>; with <math>P \geq 0</math> exactly <math>2 = \{\text{identity}, A_3 \text{ diagram flip}\}</math>); glue FLUXES <math>F_i = (64, 60, 64) = \dim \mathfrak{g}_i</math>, total <math>188 = 248 - 60</math>, flip-invariant; flux per charged root current uniformly ONE quantum. [E] LEVEL FORMULA, honest: “level = total open-string flux” is KILLED by the lockstep test itself (<math>k_i = (64, 60, 64)</math> unequal = the FLAVOUR multiplicity); what works: <math>k = \text{flux per adjoint current} = F_i / \dim \mathfrak{g}_i = (1, 1, 1)</math>, anchored by the lattice current count <math>(240, 0, 0, 0)</math> for <math>k = 1..4</math> and the embedding index <math>j(D_5 \subset E_8) = j(A_3 \subset E_8) = 1</math> (<math>60 = 2h^\vee</math>). ORD-4-VS-LEVEL-1 RESOLVED: the clock order counts FRACTIONAL flux sectors — <math>\mu = \det(D_5) \det(A_3) = 16 = \text{ord}^2</math>, the <math>\mu_4</math> glue diagonal isotropic + Lagrangian, KLM <math>16 \rightarrow 16/4^2 = 1</math> (zero residual fractional flux); NEW DIAL: <math>\#\text{primaries}((E_8)_k) = (1, 3, 5, 10, 15, 27)</math> for <math>k = 1..6</math> from the affine marks — exactly ONE sector iff <math>k = 1</math>. [E] LOCKSTEP THEOREM (the lifting of v505 “one scale <math>\Rightarrow</math> one level” to a THEOREM): clock invariance forces <math>a_3 = a_2 = a_1 = 0</math>, one <math>\mu_4</math> orbit of branch points, <math> \Pi_j  = \sqrt{2}t</math> EQUAL on all three spheres, monodromy = the pure phase <math>i</math>, <math>\det(A - 1) = -4</math>: no invariant flux vector — <math>k_1 = k_2 = k_3</math> IS A THEOREM; NEGATIVE PROBE (new falsifier): the clock-forbidden family <math>Z^4 - Z</math> (disc <math>-27</math>, branch points <math>\{0, 1, \omega, \omega^2\}</math> not a <math>\mu_4</math> orbit): <math>0/24</math> orderings lockstep; HONEST LIMIT: uniform flux doubling keeps the lockstep — EQUALITY, not the value (1 from the current/sector counters and the minimal quantum <math>N = 1</math>). [E] NEGATIVE CONTROLS: <math>k = 2</math> (count 0, residual 360, prefactor <math>-31/48</math>, <math>\#\text{prim} 3</math> — the lockstep dial honestly does NOT fire); <math>SO(16)</math> (fluxes <math>(0, 60, 0)</math>: spheres flux-dark, condensation stops at <math>4 = \det \text{Cartan}(D_8)</math>); <math>A_2</math> (<math>\mu = 12</math> not a perfect square: NO Lagrangian glue, Coxeter <math>3 \neq 4</math>). [C] the CPS dictionary itself on <math>\mathbb{P}T/\mathbb{Z}_4</math> (their geometry is the <math>\mathbb{C}^2</math> blow-up with ONE <math>(-1)</math>-sphere and <math>\mathfrak{so}(8)</math> at negative level — not the <math>A_3</math> ALE). [O] the type-I B-model backreaction on <math>\mathbb{P}T/\mathbb{Z}_4</math> (the <math>A_3</math> <math>\Omega_N</math>) — the same fence as v502/v505; SEAM.EQUIV.01 untouched; no marker moves. Exact (sympy + Fraction). [E][C][O]</p> |

| Script                   | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v510_seam_bit_freedom.py | <p>SEAM.BIT.FREEDOM.01: the freedom attack on the v506/v507 alignment bit — the POSITION half of the bit is topology (Part A dihedral/Fock + Part B Moebius/RP in one module; NO marker moves — the modulus datum stays [C]). Exact sympy + exact Cl(16) Fractions, no floats. [E] DIHEDRAL THEOREM: on the <math>N</math>-site seam circle the free involution is UNIQUE = the antipode (<math>N = 16</math>: 17 involutions in <math>D_{16}</math>, exactly 1 free = shift 8; all 16 reflections have exactly 2 circle fixed points; robustness <math>N = 8, 12</math>); the census is COMPLETE: <math>\text{Aut}(C_{16}) = D_{16}</math> exactly (brute force over all <math>8!</math> permutations at <math>N = 8</math>, propagation at <math>N = 16</math>); <math>N = 9</math> control: ZERO free involutions (even carrier count, consistent with <math>16 = 2^{g_{\text{car}}-1}</math>); QUOTIENT TOPOLOGY (the P1 tie): circle/antipode = CIRCLE (<math>\chi = 0</math>, closed), circle/reflection = INTERVAL (<math>\chi = 1</math>, two corners) — the <math>6\pi = 2\pi + 2\pi + 2\pi</math> Gauss–Bonnet budget counts three CLOSED circles, so “the deck is free on the seam circle” IS the established P1 datum “the seam is a closed circle”, not a new premise. [E] NONSPLIT <math>\iff</math> FREE (complete census, exact Cl(16)): ALL 17 involutions implemented — the free one’s NS lift squares to <math>256 \gamma_1 \cdots \gamma_{16} = (-1)^F</math> (nonsplit, 2 roots = the <math>\mathbb{Z}_8</math> clock tower); ALL 16 reflections have <math>U^2 = \text{SCALAR}</math> (<math>2^7</math> site-, <math>2^8</math> edge-axis; split, 0 roots); chain: free <math>\Rightarrow</math> shift 8 <math>\Rightarrow</math> crossing (all 28 invariant 4-sets) <math>\Rightarrow</math> central class <math>\Rightarrow</math> the edge/silver arrangement is EXCLUDED; Klein control (covering decks are free regardless of the gluing); branch control: the pillowcase involution has exactly 4 fixed points = the marks and restricts to a REFLECTION on invariant circles — the edge class IS the BRANCHED involution’s restriction: silver mistakes the mark-creating branch <math>\mathbb{Z}_2</math> for the seam deck. [E] REAL-STRUCTURE CLASSIFICATION: the deck-commuting antiholomorphic involutions of <math>\mathbb{P}^1</math> are EXACTLY two families — <math>\mu\bar{z}</math>, <math> \mu  = 1</math> (fix LINE through the deck poles <math>\{0, \infty\}</math>: deck NOT free) and <math>\mu/\bar{z}</math>, <math>\mu &gt; 0</math> (fix circle <math> z  = \sqrt{\mu}</math> avoiding the poles: deck FREE; <math>\mu &lt; 0</math>: empty); per configuration the mark-fixing real structure is UNIQUE; table: <math>\mu_4 \rightarrow</math> equatorial <math>1/\bar{z}</math>, FREE (v506 A-S2.9); silver <math>\{\pm 1, \pm(3+2\sqrt{2})\} \rightarrow</math> real axis THROUGH the poles, NOT free; generic-unit <math>\{\pm 1, \pm(3+4i)/5\} \rightarrow</math> equatorial, free WITHOUT harmonicity; hexagonal <math>\rightarrow</math> NO mark-fixing real structure (marks not concyclic: RP-incompatible, consistent v503); one-sidedness TYPES the <math>\mathbb{Z}_2</math> as the free antipode (quotient <math>\mathbb{RP}^2 = \text{the }  \mathbb{Z}_2 </math> of <math>c_3 = 1/( \mathbb{Z}_2  2\pi\chi)</math>, v456). [E] HARMONIC + FREE <math>\Rightarrow \mu_4</math> EXACTLY: the deck-pair cross-ratio <math>(1-b)^2/(1+b)^2 = -1</math> solves exactly to <math>b = \pm i</math> — the silver family (harmonic AND edge) is EMPTY on free circles, harmonicity becomes SUFFICIENT. [E] HONEST COUNTERWITNESSES: “nonsplit <math>\Rightarrow</math> clock” is FALSE — discrete <math>\{0, 1, 8, 9\}</math> and continuous <math>\{\pm 1, \pm(3+4i)/5\}</math> (free, central, <math>j = 148176/25 \neq 1728</math>, no clock): the Fock dichotomy measures the CLASS, not the modulus. PREMISE TYPING: (P-i) deck = Moebius covering deck <math>\Rightarrow</math> free [standard topology; origin_theory/v456]; (P-ii) marks on the <math>\Theta</math>-fix circle = existing REALIZE [C] content — no new input. [C] THE REDUCED REST (verbatim): the alignment bit reduces from “harmonic AND central” to the square-modulus datum <math>\tau = i</math> alone; the position half is topology (edge class excluded), the modulus half stays the one carrier input. Exact (sympy + Cl(16) Fractions). [E][C]</p> |

|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v512_seam_tau_flag.py | <p>SEAM.TAU.FLAG.01: the flag-transitivity equivalence web — the <math>\tau = i</math> attack executed on the free RP seam circle: which ESTABLISHED seam datum excludes the free-but-non-harmonic configurations? (Test family <math>M(\delta) = \{\pm 1, \pm e^{i\delta}\}</math>, <math>\delta \in (0, \pi/2]</math>; NO marker moves — the bit stays [C], QGEO.REALIZE.01 and P2.TYPING.01/AX.P2.01 text-precised only.) Exact sympy + mpmath 30 digits. [E] FALSIFICATION OF BARE TRANSITIVITY: on the free RP circle <math>V_4 = \{z, -z, b/z, -b/z\}</math> acts SIMPLY TRANSITIVELY on the four marks for EVERY <math>\delta</math> (pair-exchanging inversions; complete census: deck-commuting Möbius maps = diagonal/antidiagonal) — the expectation “transitivity <math>\Leftarrow</math> v216 local equality selects <math>\tau = i</math>” is REFUTED; hardening: ALL undirected per-mark data (arc-pair multiset <math>\{\delta, \pi - \delta\}</math>, distance multiset, cone germ) are identical for every <math>\delta</math> — no local jet sees the bit. [E] THE SHARP SELECTOR: FLAG transitivity (marks AND their two sides indistinguishable) <math>\iff \delta = \pi/2 \iff \tau = i \iff</math> the clock — stabiliser jump <math>1 \rightarrow 2</math>, flag/arc orbits <math>2 \rightarrow 1</math>, order-4 rotation (<math>b^2 = -1</math> solveset <math>\{\pi/2\}</math>), mark mirror <math>z \mapsto 1/z \iff \cos \delta = 0</math>. [E] 12-FOLD EQUIVALENCE WEB (each link exact): clock rotation, <math>D_4</math>, mark mirror, flag transitivity, three spectral degeneracies (odd-doublet split <math>= (2/\pi) \ln \cot(\delta/2)</math>, zero only at <math>\pi/2</math> — counterwitness exactly <math>(2/\pi) \ln 2</math>; arc-Laplacian degeneracy <math>4/\pi</math>; the v215-K3 indicator in CLOSED FORM <math>(2\sqrt{2}/\pi)  \ln \tan(\delta/2) </math> — the v503 lattice curve analytically), <math>\rho</math>-twist existence <math>((m^2 - n^2)(t - 1/t) = 0 \iff t = 1</math>; Atiyah–Bott rationality is <math>\delta</math>-BLIND — <math>\text{Tr}(\sigma e^{t\Delta}) = 1</math> for ALL <math>\delta</math>, <math>j_{cw} = 148176/25</math> rational non-CM: rationality does NOT select), 4-cycle implementability (H4 rigidity: <math>V_4</math> with element orders <math>\{1, 2, 2, 2\}</math> cannot induce the cusp 4-cycle; centraliser scalar, <math>U^2</math> nonscalar <math>\Rightarrow</math> no projective involution — projective order exactly 4, <math>\mathbb{Z}_8</math>-shadow consistent v510), harmonic, <math>j = 1728</math>. [E] NEGATIVE CONTROLS: hexagonal (not concyclic, fails the PRECONDITIONS); silver (harmonic but topologically dead — position/modulus halves independent, consistent v510); 3 marks (impossible on the free circle: 0 invariant 3-subsets vs 28 invariant 4-subsets; bare <math>n = 3</math> transitivity already forces equal spacing — “4 counts”: the deck-pairing makes bare transitivity free of charge). [C] THE REST (verbatim): the last input reduces from a continuous modulus to ONE discrete symmetry-lift bit (<math>V_4 \rightarrow D_4</math>: side-indistinguishability of the four equally-decorated marks); v216 local equality does NOT deliver it (no local jet can see the side bit); its negation is now concretely measurable (odd-split <math>(2/\pi) \ln \cot(\delta/2) \neq 0</math>). Scoreboard: the counterwitness passes all 7 established unsided tests, fails all 9 clock-equivalent ones. Exact (sympy + mpmath). [E][C]</p> |

| v513_celestial_<br>dterm_<br>nonderivation.py | <p>CELEST.DTERM.NONDERIV.01: the <math>c_d</math> negative certificate — can geometry derive <math>c_d = 1920</math>? An anti-numerology certificate in the v508 style (honest rigid NEGATIVE result): the v511 [C] fence “<math>1920 =  W(D_5) </math>” stress-tested via four candidate routes with a PRE-DECLARED look-elsewhere ledger. Exact sympy/Fraction, no floats. [E] CONVENTION TABLE: <math>c_d \in \{1920, 120, 256, 32, 69120\}</math> across five normalisations — only 1 of 5 hits <math> W(D_5) </math>; the convention-STABLE content is the factorisation <math>c_d = \Phi_{T_3}(A_{\text{fix}}) \times 2h^\vee(E_8) = 32 \times 60</math>, both factors [E] (Killing propagator 60 from <math>\sum_\alpha \langle \alpha, e \rangle^2 = 120</math> over the actual roots; <math>T_3</math>-slot fixing via <math>\det(\text{P-block}) = -64 \neq 0</math>). [E] K1 DEAD: the charge-legal flux pairings <math>(1, 3)/(2, 2)</math> give 2048/1800 — they BRACKET 1920 and both MISS; the only flux hit <math>64 \cdot 60/2</math> is the FORBIDDEN <math>(1, 2)</math> pairing (charge 3 mod 4, killed by the v511 innerness theorem).</p> <p>LOOK-ELSEWHERE LEDGER: 924 expressions from 21 [E] numbers, 11 hits on 1920; control targets <math>1800 \rightarrow 8</math>, <math>2048 \rightarrow 5</math>, <math>2016 \rightarrow 0</math>. [E] K2: quantisation delivers only lattices (<math>60\mathbb{Z}</math>: 1920 = the 32nd multiple, no minimality; strict <math>\text{ch}_3</math>-unit couplings <math>2160\mathbb{Z}</math> EXCLUDE 1920); the cubic quantum is lattice-dependent (6 on coroots, <math>3/8</math> on weights); the residual integer 32 has 12 signed factorisations. [E] K3 PROVENANCE CLASH (the death blow): cubic indices <math>A_m = (0, 16, 0, -16)</math>, twisted sum <math>\sum_m i^m A_m = 32i</math> NUMERICALLY = <math>\Phi_{T_3}(A_{\text{fix}})</math> — BUT the quartic class decomposition <math>(10, -4, 30, -4)</math> is dominated by classes <math>0/2</math> while the cubic 32 is built <math>16 + 16</math> from classes <math>1/3</math>: same number, disjoint mechanism = coincidence exposed; the Weyl side is WRONG (the <math>d</math>-channel is an <math>A_3</math>-side object, <math> W(A_3)  = 24</math>; <math>D_5</math> has no cubic invariant, <math>\text{Inv}(S^3 45) = 0</math>; <math> W(E_8) / W(A_8)  = 1920</math> a second accidental 1920). [E] K4 NEGATIVE CONTROLS: <math>SO(16)/D_8</math> fails every candidate formula consistently; <math>k = 2</math> flux doubling scales the flux formula <math>\times 4</math> (7680); false <math>\mathfrak{g}_0 = \mathfrak{d}_5 \oplus \mathfrak{a}_2 \oplus \mathfrak{u}(1)</math> has SIX symmetric cubics; <math>\mathfrak{so}(10)</math> sanity (<math>\text{Tr } X^3 = 0</math>). VERDICT: NUMEROLOGY as a derivation claim — the v511 [C] fence stays a fence, now typed look-elsewhere-loaded; the honest [E] core is <math>c_d = 32 \times 60</math>; the physical generation of the 32 stays [O]. Exact (sympy/Fraction); no marker moves. [E]</p> |

 | Script                                               | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v516_celestial_<br>wp5e_m2_twisted_ks_<br>measure.py | <p>CELEST.WP5E.M2.01: milestone M2 of the celestial-holographic research contract CELEST.SEAM.01 (WP5e back-reaction programme) — “the twisted Kodaira–Spencer measure”, executed (SUCCESS on the preregistered v514 S8.2 criterion, on the DECLARED completion measure — verdict B): the one-loop box coefficient per sector on <math>\mathbb{PT}/\mathbb{Z}_4</math> under the completion contact term <math>\text{contact}_j = (Q^{(0)} - Q^{(j)})/\det_j</math>. Exact sympy/Fraction, no floats. [E] THE COMPLETION-WEIGHT IDENTITY (the centrepiece): per glue class the contact weights are <math>w_m = \sum_j (1 - i^{jm})/\det_j = (0, \frac{3}{2}, 2, \frac{3}{2}) = 4h_m =  \mu_4 h_m = -4\text{ch}_2(T_m)</math> EXACTLY (<math>h_m = m(4 - m)/8</math> the v502 sector Casimir energies, <math>\text{ch}_2(T_m)</math> the McKay/Kronheimer charges, v505 S4.3 index bridge): the three sphere axions pair through their OWN <math>\text{ch}_2</math> charges — an exact identity, NO free scale, no fit. [E] PARAMETER-FREE LOCKS: <math>T_5 = 0</math> for ANY scale <math>c</math> (the <math>\text{ch}_2</math> pattern alone kills <math>T_5</math>); ratio <math>h_2 : h_1 = 4 : 3 =</math> the <math>\delta_1</math>-forced leading ratio (REPRODUCED, not fitted); the <math>T_3</math> budget fixes <math>c = 4 =  \mu_4 </math> uniquely. [E] THE CONTACT TERM: channel form <math>\sum_j (Q^{(0)} - Q^{(j)})/\det_j =</math> class form <math>\sum_m 4h_m Q_m = (36, 120, 60, 0, -32)</math> EXACTLY (one object, two bases); the contacts carry nonzero <math>T_5/T_3</math> per channel (genuine contact, not exchange — the v508 product theorem replicated). [E] SUCCESS TABLE: <math>\text{skeleton}_j + \text{contact}_j = Q^{(0)}/\det_j = 36\langle x, x \rangle^2/\det_j</math> — a PERFECT Okubo square (<math>T_5 = T_3 = 0</math>, <math>\tilde{\lambda}^2 = 36</math>) in EVERY twisted channel; total <math>A_{\text{fix}} + \text{contact} = 45\langle x, x \rangle^2 = \frac{5}{4} \times 36\langle x, x \rangle^2 = \text{Dedekind} \times \text{Okubo} =</math> the UNIQUE quartic-free weighting (v505 S3.8 rigidity); both v508 certificates killed (<math>\Phi_{T_3} : 32 \rightarrow 0</math>, <math>\Phi_P : 72 \rightarrow 0</math>); the v511 slice <math>\psi = 64</math> SUPPLIED EXACTLY — no cubic <math>d</math>-channel needed (<math>c_d</math> free = 0); remainder inside the exchange span (<math>45\langle x, x \rangle^2 = \frac{45}{16}E_{22} = \frac{1}{80}E_{00}</math>), the bulk axion cancels every channel with the SAME <math>\tilde{\lambda}^2 = 36</math>; the v514 measure chain stays <math>\mu</math>-blind. [E] NEGATIVE CONTROLS: <math>c \in \{1, 2, 3, 5\}</math> leaves <math>T_3 = (24, 16, 8, -8)</math>; the <math>h_1 \leftrightarrow h_2</math> shuffle breaks <math>T_5 = -14</math> AND <math>T_3 = 36</math>; <math>SO(16)</math>: <math>T_5 = 20</math> / <math>T_3 = -40</math> remain — the KILL fires there (Okubo failure inherited, <math>E_8</math> doubly special); <math>\text{diag}(i, i)</math> degenerates to the <math>\mathbb{Z}_2</math> target and breaks the conjugation pairing + the index bridge; the <math>\mathbb{Z}_2/\text{Eguchi–Hanson}</math> anchor PASSES (<math>9\langle x, x \rangle^2 = \frac{1}{4} \times 36</math>, scale <math>2 =  \mathbb{Z}_2 </math>). [E] MULTIPLIER NOTE (cross-reference to <math>\delta_{1d}</math>): the contact weights are real rationals with no multiplier system of their own; the <math>\delta_{1c}</math> residual phases = the SQUARES of the <math>A_3</math> discriminant <math>T</math>-phases, orders <math>(1, 4, 1, 4)</math>. [C] THE COMPLETION READING (the fence): the loop of twisted states carries the UNPHASED sector trace with the same zero-mode normalisation — declared, supported by the <math>\delta_1</math> modular-completion finding, NOT derived from the BCOV integral. [O] the BCOV-integral derivation (<math>\delta_{1b}/\delta_{1c}/\delta_{1d}</math> territory); SEAM.EQUIV.TWISTOR.01 untouched. VERDICT: SUCCESS wording met on the declared measure; the KILL does NOT fire; no marker moves. [E][C][O]</p> |

| v517_celestial_<br>wp5e_m3_a0_<br>uplift.py | <p>CELEST.WP5E.M3.01: milestone M3 of the celestial-holographic research contract CELEST.SEAM.01 (WP5e back-reaction programme) — “the <math>a_0</math> uplift”, executed (SUCCESS on the preregistered v514 S8.3 criterion): the <math>(4, \pm 4)</math> GH multipole uplifted to the twistor-potential kernel <math>\chi = \log P_4</math> (the log of the v515 family polynomial) with the induced Kähler-potential correction. Exact symplectic, no floats. [E] KERNEL BRIDGE: the <math>O(2)</math> section is a NULL coordinate — <math>\Delta_{3d} G(\eta_p) = 0</math> identically for an ARBITRARY kernel <math>G</math> (the uplift is well-typed); RESIDUE IDENTITY <math>\partial_x[\text{transform}(\log \eta_p)] = 1/r_p</math> EXACTLY (residue <math>1/(2r)</math>): the GH potential <math>V = \sum_p 1/r_p</math> IS the <math>x</math>-derivative of the contour transform of <math>\chi</math>; flux <math>-4\pi</math> per centre, source charge <math>4 =  \mu_4 </math> (the <math>V</math>-ledger matched). [E] FOUR COUPLED CENTRE-COUNT SCALES: (1) asymptotic kernel log <math>\chi = 4 \log \eta + a_2/\eta^2 + (a_0 - a_2^2/2)/\eta^4 + \dots</math> — LOG COEFFICIENT <math>4 =  \mu_4 </math> = centre count (the CPS “<math>N \log</math>” analogue at kernel level); at the clock-fixed seam fibre <math>\zeta = 0</math> the <math>a_2</math> slot closes and the first correction is EXACTLY <math>a_0/\eta^4</math> = the <math>(4, \pm 4)</math> multipole; exact <math>m</math>-grading (<math>m = \pm 4</math> pieces PURE <math>a_0</math>, <math>m = 0</math> piece <math>\varphi_0</math>-free); NO <math>\log \times \text{power}</math> terms (the v514 honest zero preserved); (2) the GLT tower <math>\sum_p \eta_p \log \eta_p = 4\eta \log \eta + p_4/(12\eta^3) + \dots</math> with <math>p_n = 0</math> unless <math>n \equiv 0 \pmod 4</math> and <math>p_{4k} = 4(-a_0)^k</math>; (3) the exceptional-locus log <math>\chi(0) = \log a_0 = 4 \log t_0 + i(4\varphi_0 + \pi)</math>, modulus response 1 at the locus vs power-law at infinity (v514 S6.3 uplifted); (4) periods: <math>d \log \Pi_j / d \log a_0 = 1/4 = 1/ \mu_4 </math> uniform, integrated monodromy <math>e^{2\pi i/4} = i</math> = ONE Coxeter clock step (v493 reproduced from perturbation theory); node <math>\lambda</math>-support <math>a_0</math>-RIGID (the <math>\mathbb{Z}_8</math> seam bridge), <math>K_4</math> discriminants <math>\sim t_0^2 \neq 0</math> (the forced flux vector persists), BM kernel modulus-free with <math>\int K = (2\pi i)^2</math>. [E] NEGATIVE CONTROLS: <math>(4, 0)</math> clock-invariant (<math>\varphi_0</math>-free in <math>V</math> AND kernel: breaks nothing); <math>\mathbb{Z}_2/\text{EH}</math> analogue: EVERY dial reads <math>2 =  \mathbb{Z}_2 </math> (<math>(2, \pm 2)</math> amplitude <math>\frac{3}{2} \sin^2 \theta</math>, kernel log 2, exceptional log <math>2 \log t_0</math>, response <math>\frac{1}{2}</math>, monodromy <math>-1</math>); <math>k = 3, 5</math> orbits: coefficient <math>k</math>, slot <math>O(6)/O(10) \neq O(8)</math> — the observable MOVES with the centre count; forbidden family <math>Z^4 - Z</math>: <math>p_3 = 3 \neq 0</math> (selection rule broken), <math>e_4 = 0</math> (no <math>a_0</math>-log) — fails BOTH dials. [C] the GLT dictionary (<math>\eta_p \log \eta_p</math> = the GH Kähler-potential kernel; Lindström–Roček / Ivanov–Roček). [O] the full nonlinear Kähler potential of the resolved <math>A_3</math> ALE; SEAM.EQUIV.TWISTOR.01 untouched. VERDICT: SUCCESS (log correction <math>\propto 4 =  \mu_4 </math>, coupled to the centre count on four scales); the KILL (decoupling) does NOT fire; no marker moves. [E][C][O]</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v518_celestial_<br>wp5e_delta1_<br>derived_kill.py | <p>CELEST.WP5E.DELTA1.01: the <math>\delta_1</math> chain (<math>\delta_{1b} + \delta_{1c} + \delta_{1d}</math>) of the celestial-holographic research contract CELEST.SEAM.01 DECIDED — “the derived chiral measure kills the <math>\delta_1</math> route”, an honest, decided NEGATIVE result (v508 style): does the Harvey–Moore/BCOV fundamental-domain integral on <math>\mathbb{PT}/\mathbb{Z}_4</math>, evaluated under a measure DERIVED from blockwise <math>SL(2, \mathbb{Z})</math> covariance (solved for, not declared, not scanned), deliver <math>-A_{\text{fix}} = -(9, -30, -15, 0, 32)</math> or the <math>\psi = 64</math> slice? NO — every member of the derived family fails all three preregistered testers. [E] THE 16-COMPONENT WEIL COMPLETION (<math>\delta_{1c}</math>): discriminant module <math>\mathbb{Z}_4 \times \mathbb{Z}_4</math> with <math>q = (5x^2 + 3y^2)/8</math>; Gauss sums <math>2\zeta_8^5 \times 2\zeta_8^3 = 4 = \sqrt{16}</math> (signature 0 mod 8 = rank <math>E_8</math>); <math>S</math> symmetric + unitary, <math>S^2 = C</math>, <math>(ST)^3 = S^2</math>, <math>S^4 = 1</math>, <math>T^8 = 1</math> EXACTLY in <math>\mathbb{Q}(\zeta_8)</math>; <math>S = S_{D_5} \otimes S_{A_3}</math>; the diagonal <math>H</math> and anti-diagonal <math>H'</math> are the two invariant Lagrangians (both counts = <math>E_4</math>: two <math>E_8</math> gluings); <math>P_H S P_H = \frac{1}{4}J</math> with <math>3/4</math> of every <math>S</math>-image weight on the 12 shifted classes; the 16-vector theta <math>S</math>-covariance CLOSES: the <math>\delta_{1b}</math> E1.5 residual <math>2.91 = O(1)</math> drops to <math>\sim 10^{-39}</math>. [E] THE OBSTRUCTION IS A FINITE <math>\mu_4</math> CHARACTER, IDENTIFIED (<math>\delta_{1d}</math>): gauge blocks <math>M = G[a, b] \eta^{-8}</math> have constant transport <math>(t_p, s_p)</math> (28+ digits) recognised as exact <math>1/960</math>-grid phases; the <math>T</math>-fixed pairs <math>(0, b)</math> carry <math>t = e(-1/2) = -1</math> EXACTLY; loops land in <math>\Gamma_1(4)</math> resp. <math>\Gamma_0(2)^\pm</math>, joint holonomy eigenspaces dim <math>8/16</math> resp. <math>6/16</math>, every eigen-phase of order <math>\leq 4</math>; KOBOUNDARY TEST: the relation defects <math>c_{S^4}</math>, <math>c_{(ST)^3 S^{-2}}</math>, <math>c_{[S^2, T]}</math> are <math>(1, 1, 1)</math> EXACTLY on all 15 pairs — a CHARACTER of the stabilisers, NOT a genuine 2-cocycle on <math>SL(2, \mathbb{Z})</math>; on <math>\Gamma_1(4)</math>: <math>\lambda(\gamma) = i^{2B+C/4}</math>. [E] THE CANCELLATION IS THE TWISTED FIBRE BLOCK <math>f_1 f_3</math>, NOT THE THREE SPHERE AXIONS: exact identity <math>G[a, b] = f_1 f_3</math> (30+ digits); the <math>T</math>-fix mechanism is one line of exact phase arithmetic: <math>(-1) \times e(-1/6) = e(1/3) = \chi_4(T)</math> at every <math>T</math>-fixed node; CANCELLATION TABLE (exact, minimal residual order over <math>\eta^m \times \chi_k</math>): none <math>\rightarrow 4</math>, <math>f_1 f_2 f_3</math> (the three sphere axions) <math>\rightarrow 4</math>, <math>f_2 \rightarrow 6</math>, <math>f_1 f_3 \rightarrow 1</math> (hol AND anti), wrong weights <math>\rightarrow 4</math>; strict solutions exactly <math>\chi_4</math> (dims <math>(3, 3)</math>) and <math>\chi_{10}</math> (dims <math>(1, 1)</math>) at <math>\eta^0</math>, certified on the dressed functions (<math>10^{-15}</math>, NO residual multiplier). [E] THE DECISION — ALL THREE TESTERS FAIL: under both derived solutions the integral fails <math>T_5(V) = 0</math> (fractions <math>0.5 / 0.83</math>), fails <math>W_2 : W_{13} = 4 : 3</math> (<math>W_{13} = 0</math>), fails <math>V = -A_{\text{fix}} N</math> (spreads <math>1.05 / 1.47</math>) and the <math>\psi = -64N</math> slice; the honest <math>(N_1, N_2)</math> rebalance: <math>\chi_4</math> reaches <math>T_5 = 0</math> only at <math>\psi &gt; 0</math>, <math>\chi_{10}</math> only at <math>N_2/N_1 = -4 &lt; 0</math> (outside the orbifold projector) — no branch fires in the positive cone. [E] NEGATIVE CONTROLS: <math>\mathbb{Z}_2</math>/Eguchi–Hanson (gauge-only residual order 2 — the <math>\mu_4</math> defect is <math>\mathbb{Z}_4</math>-specific — and the SAME fibre dressing cancels it to 1); <math>SO(16)/D_8</math> (only even sectors, all axion <math>b</math>-characters in <math>\mu_2</math>: the order-4 supply structurally absent); wrong form <math>(x^2 + y^2)/4</math> (<math> G ^2 = 64 \neq 16</math>, its <math>S</math>-rule fails at <math>O(1)</math>); wrong signature (<math>S^2 = C</math> breaks exactly). [C] the <math>f_1 f_3 = \text{KS-weight identification}</math> (deck weights <math>(1, 3) = \text{the twistor fibre weights } (+1, -1 \bmod 4)</math> forced by the v514 incidence ledger — exact match, NOT a complete BCOV derivation) + the kernel-family convention + the discrete <math>\chi_k</math> choice (both evaluated, both fail). TENSION, stated honestly (the mandatory fence): the DECLARED completion reading (v516/M2) delivers the <math>\psi = 64</math> slice and cancels <math>32 T_3</math>; the DERIVED chiral measure (this module) fails all three testers — both are exact; the sharp open question is which of the two is the true BCOV measure (the declared reading is supported by the <math>\delta_1</math> modular-completion finding but not derived; the derived measure rests on the <math>f_1 f_3</math> identification). Neither result is hidden behind the other. [O] the BCOV-integral derivation on <math>\mathbb{PT}/\mathbb{Z}_4</math> that decides between the two measures — the single open item of the <math>\delta_1</math> strand; the twisted-contact route of v508 S6.2 is DECIDED NEGATIVE under the derived measure. NO marker moves anywhere. [E][C][O]</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v519_woit_theta_rp_free.py | <p>WOIT.THETA.FREE.01: the WOIT-<math>\alpha</math> milestone of the OS twistor bridge</p> <p>WOIT.OS.TWISTOR.01 — “the real structure exists, and free reflection positivity picks the SAME family” (Part W = the anti-linear <math>\Theta</math>: classification, exact relations, kill test 1 on the free/equivariant level; Part R = reflection positivity of the free 16-Majorana NS seam system under the pinned <math>\Theta</math>; NO marker moves — WOIT.OS.TWISTOR.01 stays <b>[O]</b>: kill test 1 is discharged on the FREE level only and stays formally live on the interacting algebra). Exact symplectic + exact <math>\text{Cl}(16)</math> Fractions; the RP definiteness certificates are 40-digit spectra of exact Hermitian matrices. <b>[E]</b> THETA CLASSIFICATION COMPLETE: exactly TWO families of anti-linear structures on <math>\mathbb{C}^2</math> normalise the clock <math>\rho = \text{diag}(i, 1)</math> — family D (<math>z \mapsto \mu\bar{z}</math>, <math> \mu  = 1</math>): <math>\Theta\rho\Theta = \rho^{-1}</math> EXACTLY, <math>\Theta^2 = +1</math> (−1 IMPOSSIBLE: <math>MM = \text{diag}( \mu ^2, 1)</math> — Kramers-free), inverts the deck, fixed set = the great circle through the deck poles; family A (<math>z \mapsto \mu/\bar{z}</math>): centralises the clock projectively (NEVER inverts), <math>\Theta^2 = \pm 1</math> per <math>\mu</math>, fixed set <math> z  = 1</math> resp. empty. ROLE SEPARATION: family A DEFINES the euclidean section (Woit’s <math>\rho_{\text{tw}}</math> side: <math>\rho_{\text{tw}}^2 = -1</math>, no real points — replicated exactly on <math>\mathbb{C}^4</math>), family D REFLECTS it (the OS conjugation; <math>\sigma_{\text{std}}</math> = the standard conjugation with real points <math>\mathbb{RP}^3</math>). <b>[E]</b> MARK PINNING: <math>z \mapsto \mu\bar{z}</math> preserves the <math>\mu_4</math> marks iff <math>\mu \in \mu_4</math> — a 4-element <math>\mu_4</math>-TORSOR (2 mark axes + 2 silver-midpoint axes); clock conjugation <math>\rho\Theta_\mu\rho^{-1} = \Theta_{-\mu} \Rightarrow 2</math> clock orbits. <b>[E]</b> SPIN/FOCK: the <math>\mathbb{Z}_8</math> plane has no phase leaks (<math>\zeta_8^k = \zeta_8^{-k}</math>); exact <math>\text{Cl}(16)</math>: <math>\Theta_{\text{Fock}} = U_r \circ K</math> with <math>\Theta_{\text{Fock}}^2 = 2^7 &gt; 0</math> (normalised +1), inverts the clock tower (<math>V \mapsto 4096 V^{-1}</math>, exact scalar) and normalises the deck; KRAMERS DICHOTOMY: the deck-induced candidate <math>\Theta_t = \tilde{U} \circ K</math> has <math>\Theta_t^2 = 256 \gamma_1 \cdots \gamma_{16} = (-1)^F</math> — the <b>v510</b> split/nonsplit dichotomy IS the <math>\Theta^2 = +1</math> vs <math>(-1)^F</math> dichotomy; the deck does NOT furnish <math>\Theta</math>, the seam-circle REFLECTION does. <b>[E]</b> KILL TEST 1 (free level): does NOT fire — <math>\Theta</math> exists with <math>\Theta^2 = +1</math> AND <math>\Theta\rho\Theta = \rho^{-1}</math> and satisfies all three side conditions simultaneously (marks, deck normalisation, spin/Fock). <b>[E]</b> FREE RP: the chiral NS vacuum <math>C(d) = (2/N)/\sin(\pi d/N)</math> has <math>C^2 = -1</math> exact; preconditions exact (<math>RCR^T = -C</math>, <math>SCS^T = C</math>, <math>RSR^{-1} = S^{-1}</math>; the deck FAILS anti-invariance); BOND CUT: one-particle Gram <math>(8, 0, 0)</math> PD (min eigenvalue <math>1.888 \times 10^{-3}</math> at 40 digits), even <math>\deg \leq 2</math> sector <math>(29, 0, 0)</math> PD, <math>N = 8</math> complete half-sided algebra PD (even + odd each <math>(8, 0, 0)</math>) — free RP with NO degree truncation; the twist <math>\eta = +i</math> is FORCED (<math>\eta = 1</math> non-Hermitian); CONTROLS: the site cut fails exactly (<math>\det = 0</math>, inertia <math>(3, 3, 1)</math>); continuum control: the Cauchy–Stieltjes factorisation is strictly PD — a lattice-PLACEMENT artifact: RP selects the site placement relative to the marks); the clock-CENTRALISING family-A structure fails RP structurally <math>((4, 4, 0))</math> — RP and <math>\Theta\rho\Theta = \rho^{-1}</math> select the SAME family; bonus: the anti-chiral state flips the odd sector to <math>(0, 8, 0)</math> ND (the free shadow of kill test 3). <b>[C]/[O]</b> NOT shown: the interacting algebra <math>\mathcal{A}_{\text{hol}}</math> (kill test 1 stays live there), gauge-fixed RP (kill test 2), the OS reconstruction, chirality without mirrors (kill tests 3/6 — only the free odd-sector shadow), <math>\mu_4</math> incidence (kill test 7); WOIT-<math>\beta/\gamma</math> roadmap: <math>(\beta_1)</math> <math>\Theta</math> on the gauge-invariant subalgebra + gauge-fixed RP on the equivariant <math>\text{SDYM}(E_8)</math> sector; <math>(\beta_2)</math> the OS quotient of the free system explicit; <math>(\beta_3)</math> the <math>\mathbb{PT} \leftrightarrow \mathbb{PT}^*</math> duality vs <math>\sigma_{\text{std}}</math> typed; <math>(\gamma)</math> the chirality theorem + the mark incidence. Two contract PRECISIONS (prose, no marker): (i) “<math>\Theta</math> induced by the seam reflection” means the seam-circle REFLECTION, not the deck (the deck furnishes the <math>(-1)^F</math> Kramers class — the <b>v510</b> bridge); (ii) the marks sit RP-side on the BOND MIDPOINTS of the 16-Majorana circle. <b>[E][C][O]</b></p> |

|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v520_celestial_<br>wp5e_measure_<br>decision.py | <p>CELEST.WP5E.MEASURE.01: the WP5e BCOV measure question DECIDED at probe level (<math>\delta_{1e} + \delta_{1f}</math> consolidated, v518 style) — “single-valuedness is derived, the completion reading wins”: which of the two exact, contradictory measures on <math>\mathbb{P}T/\mathbb{Z}_4</math> is the true BCOV measure, (A) the DECLARED completion reading (v516) or (B) the DERIVED chiral measure (v518)? ERFOLG-A on the decision layer. [E] INVARIANT SUBSPACE: <math>\dim_{\mathbb{Q}}\{v : \rho(T)v = v, \rho(S)v = v\} = 8 = 4 \times 2</math> in the dressed 16-component Weil system, EVERY kernel vector in the <math>\mathbb{Q}(\zeta_8)</math>-span of <math>\{e_H, e_{H'}\}</math> (the two Lagrangian gluings, both <math>\theta = E_4</math>, level-1 quartic <math>= Q^{(0)}</math> = the unphased trace); strict trivial-character solutions at <math>(m, k) = (0, 0)</math>: ZERO for every dressing (11 combinations). [E] SOURCE 1 (F-LEMMA): the only strict chiral families <math>\chi_4</math> (dims (3, 3)) and <math>\chi_{10}</math> (dims (1, 1)) carry nontrivial <math>T</math>-characters exactly; pointwise covariance of the canonical column member certified (<math>3.9 \times 10^{-16}</math>, <math> G  \geq 59.6</math>); EXACT change of variables <math>\Rightarrow</math> fundamental-domain independence forces <math>\int = 0</math> for EVERY chiral integrand — the v518 route was never a well-defined nonvanishing moduli integral (kill SHARPENED). [E] SOURCE 2 (QUILLEN PAIRING): <math> t\bar{t} - 1  &lt; 8.3 \times 10^{-40}</math> on all 15 pairs/both generators; <math> \chi_4 ^2 = 1</math> exact vs one-sided <math>\chi_4^2 = e(2/3) \neq 1</math> (<math>T</math>-fixed: <math>640 \not\equiv 0 \pmod{960}</math>, 15/15 defective); the doubled 256-dim hol <math>\times</math> antihol Weil system closes STRICTLY at trivial character and physical weight (nullspaces <math>(28, 17) \geq 11</math>), contains the unphased diagonal (<math>\sim 2 \times 10^{-15}</math>) AND the physical columns <math>w_b \otimes \bar{w}_b</math> (<math>\sigma</math> <math>4.9 \times 10^{-16}/8.3 \times 10^{-16}</math>); negative control hol <math>\otimes</math> hol: EMPTY nullspace (0, 0). [E] CONSISTENCY CLOSURE: the forced unphased numerator in the v518 scaffold reproduces <math>\sum_m V \propto (1, 2, 1, 0, 0) = \langle x, x \rangle^2</math> exactly on every level <math>n \leq 8</math>; <math>J</math>-weighted spreads <math>\sim 5 \times 10^{-41}</math>, <math>T_5/T_3 \sim 7 \times 10^{-42}</math>, zero negative cells; <math>\psi(\text{skeleton}) = +0.2302 = -\psi(\text{contact})</math>, the <math>J</math>-weighted mirror image of <math>\psi(A_{\text{fix}}) = +64/\psi(\text{contact}) = -64</math>; linearity <math>4.6 \times 10^{-41}</math> — the circle to v516 is CLOSED. [E] D3 <math>\mathbb{Z}_2/\text{EH}</math> ANCHOR: only the declared reading hits (<math>9\langle x, x \rangle^2 = (1/4) \times 36</math>, <math>\psi = -8</math>, scale tooth <math>c = 1/2 =  \mathbb{Z}_2 h^{A_1}</math>); all three derived instantiations fail (spreads 1.12/0.895/0.516, <math>\psi</math> sign wrong). [E] D1 COLUMN CANONICALISATION: the physical AB column <math>\sum_m i^{bm} e_{(m,m)}</math> is EXACTLY contained in the <math>\chi_4</math> family (<math>\sigma</math> <math>1.8 \times 10^{-16}/1.7 \times 10^{-16}</math>, one scalar per orbit — canonicalises the <math>(N_1, N_2)</math> freedom); the canonical member still fails all testers. [E] NEGATIVE CONTROLS: <math>SO(16)/D_8</math> (<math>T_5 = 20/T_3 = -40</math> exact, <math>\mu_2</math>-only), wrong form (<math> \text{Gauss} ^2 = 64</math>), wrong weight (dev 0.78), shuffle (<math>T_5 = -14/T_3 = 36</math>), planted family detected (<math>1.5 \times 10^{-16}</math>), hol <math>\otimes</math> hol empty. [C] TYPED PREMISES (the mandatory fence): TP-1 (F-independent moduli integral), TP-2 (nonvanishing — must source <math>\psi = 64</math>), TP-3 (v518 kernel convention), TP-4 (Quillen structure of BCOV <math>F_1</math>). [O] the constructive BCOV derivation of the <math>w_m</math> normalisation itself. VERDICT: ERFOLG-A per the preregistered criteria (both sources independent, the consistency closure carries); the [O] question “which is the true BCOV measure” is DECIDED at probe level in favour of (A) under TP-1..TP-4. SEAM.EQUIV.TWISTOR.01 stays Open; NO marker moves. [E][C][O]</p> |

|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v521_seam_bit_rp_blind.py | <p>SEAM.BIT.RPBLIND.01: the RP/<math>\Theta</math> attack on the alignment bit DECIDED — “free OS positivity does NOT see <math>\delta</math>”, an honest, decided NEGATIVE result (v508 style): does free reflection positivity (v519) or anti-linear <math>\Theta</math> existence break for <math>\delta \neq \pi/2</math> on the deformed mark family <math>M(\delta) = \{\pm 1, \pm e^{i\delta}\}</math>, which would derive the v512 alignment bit from OS positivity? NO — the free RP/<math>\Theta</math> battery is the EIGHTH side-blind test on the v512 scoreboard (<math>7 \rightarrow 8</math>); the bit remains genuine discrete input. [E] CENSUS (exact solvesets, symbolic <math>\delta</math>): for every <math>\delta</math> exactly the two mark-SWAPPING reflections <math>\Theta_{\pm e^{i\delta}}</math> exist (axes <math>\delta/2, \delta/2 + \pi/2</math>; all 20 cut/mark incidence solvesets EMPTY); mark-FIXING reflections exist exactly at <math>\delta = \pi/2</math> (solveset <math>\cos \delta = 0</math>, lost immediately at <math>\pi/2 - \varepsilon</math>); the v510/v512 counterwitness <math>\{\pm 1, \pm(3+4i)/5\}</math> carries the swap pair exactly. [E] RP IS <math>\delta</math>-BLIND: bond-cut Gram inertias <math>(8, 0, 0)</math> PD for all tested <math>\delta</math>, spectra IDENTICAL to 40 digits (deviation 0.0) — the ENTIRE free-RP spectral datum carries ZERO <math>\delta</math> information; the <math>N = 16</math> odd-<math>m</math> failure (site axes, <math>(3, 3, 1)</math>, <math>\det = 0</math>) is a lattice-PLACEMENT artifact: at <math>N = 32</math> ALL <math>m = 1..7</math> (<math>\delta = m\pi/8</math>) have mark-compatible BOND axes with PD inertia <math>(16, 0, 0)</math>; continuum: the OS kernel in axis-adapted coordinates is EXACTLY <math>1/\sin((s+t)/2)</math>, the axis position drops out identically (Cauchy–Stieltjes PD); the counterwitness PASSES free RP (6-point Gram <math>(6, 0, 0)</math>). [E] <math>\Theta</math> EXISTENCE <math>\delta</math>-BLIND: <math>\Theta^2 = +1</math>, deck normalisation and Fock implementability (<math>U^2 = +2^7/2^8 &gt; 0</math>, exact <math>\text{Cl}(16)</math>) for every <math>\delta</math>; the ONLY <math>\delta</math>-sensitive v519 clause (<math>\Theta\rho\Theta = \rho^{-1}</math>) is for <math>\delta \neq \pi/2</math> not violated but NOT FORMULABLE (a mark-compatible order-4 rotation exists iff <math>\delta = \pi/2</math>) — it PRESUPPOSES the bit; same for the clock-tower clause. [E] the battery has teeth at every <math>\delta</math>: family A/antipode fails RP structurally (zero diagonal, <math>(4, 4, 0)</math> indefinite), chirality-<math>\eta</math> pinning persists <math>((0, 8, 0)</math> ND) — RP separates the two real-structure FAMILIES, never the SIDES. [E] precondition controls: hexagonal (marks not concyclic, no seam circle), silver (deck not free), lifting audit (B = index relabelling, <math>\delta</math>-blind by construction; B' fails the <math>\pi/2</math> negative control — discarded). [C] FACE #13 of the v512 equivalence web: the group generated by the admissible OS reflections is <math>V_4</math> for every <math>\delta &lt; \pi/2</math> and closes to <math>D_4</math> exactly at <math>\delta = \pi/2</math> (<math>\Theta_i \circ \Theta_1 = \text{the clock}</math>) — <math>12 \rightarrow 13</math> faces, a typed REFORMULATION of the bit, not a derivation. [O] honest gap: marks decorating the STATE (defect/twist insertions, interacting <math>\mathcal{A}_{\text{hol}}</math>) = exactly v519's [O] scope — there, and only there, could positivity still see the bit. VERDICT: KILL exactly as preregistered; the alignment bit is NOT derivable from OS positivity and remains genuine discrete input; no marker moves. [E][C][O]</p> |

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v522_woit_beta1_<br>gso_gauge.py | <p>WOIT.BETA1.GS0.01: the WOIT-<math>\beta_1</math> milestone of the OS twistor bridge</p> <p>WOIT.OS.TWISTOR.01 executed — “the clock is time-like, GSO is the gauge datum” (typed result: verdict UNDECIDED per the frozen preregistration, mechanism identified exactly, gauge-fixed RP established under the corrected GSO typing). [E] HERMITICITY WITNESS: the <math>\mu_4</math> clock average violates Hermiticity EXACTLY (the one-step insertion <math>T_1 = \langle \theta(e_a), \alpha_S(e_b) \rangle</math> has entry <math>-i/(8 \sin(5\pi/16))</math> where the conjugate transpose demands <math>+i/(8 \sin(5\pi/16))</math>); the pairing is complex-SYMMETRIC (745 entries matching, 96 anti-matching, 0 violations) — “OS-symmetric” is strictly weaker than Hermitian: “positivity after gauge fixing” is not well-posed for the clock reading. [E] TIME-LIKE TYPING: ALL 16 dihedral reflection axes of the NS seam circle invert the clock lift (<math>RSR^{-1} = S^{-1}</math>), NONE commutes — the <math>\mu_4</math> clock IS Woit’s euclidean rotation (the time translation itself); the gaugeable (<math>\theta</math>-compatible) part of the <math>\mathbb{Z}_8</math> tower is EXACTLY its 2-torsion <math>\{1, (-1)^F\}</math> (Hermiticity census over all powers; <math>\alpha^4 =</math> the full wrap = the <math>2\pi</math> rotation of the seam = fermion parity, lattice spin-statistics). [E] POSITIVE PART — GSO-FIXED RP HOLDS EXACTLY: <math>N = 16</math> even <math>\deg \leq 2</math> parity-projected bond-cut Gram (29, 0, 0) PD (min eigenvalue <math>1.78 \times 10^{-6}</math> at 40 digits); <math>N = 8</math> complete half algebra: the projected Gram kills all odd rows/columns exactly, even block (8, 0, 0) PD (<math>3.35 \times 10^{-3}</math>), no degree truncation; the site-cut defect SURVIVES gauge fixing ((7, 9, 6)) — the RP bond placement is gauge-invariant information; family A keeps failing ((17, 12, 0) indefinite vs family D’s (29, 0, 0)); Kramers: <math>\Theta_t^2 = \text{id}</math> on <math>\mathcal{A}^G</math>, <math>\Theta_{\text{Fock}}</math> restricts with <math>\Theta^2 = +1</math>; Ramond control: the wrap +1 “true <math>\mathbb{Z}_4</math>” lift fails state invariance — the <math>\text{NS}/\mathbb{Z}_8</math> tower is forced. [E] KILL-TEST BOOKKEEPING: kill test (1) stays discharged also gauge-invariantly (RP separates the families on the invariant sector); kill test (2)’s free shadow does NOT fire (no legitimate Hermitian gauge-fixed form has a negative direction); both stay formally live on the interacting algebra <math>\mathcal{A}_{\text{hol}}</math>. [E] WRONG-PROJECTION CONTROLS: invariant-dimension chain parity <math>120 &gt;</math> deck <math>64 &gt;</math> clock <math>32</math> strict, but Hermiticity singles out PARITY alone (deck and clock averages non-Hermitian): the finer “gauge” projections are structurally ill-posed pre-quotient. TRANSPARENCY: the first frozen run scored 6/13 and the preregistered deg-2 invariant dimension 30 was a combinatorial error (correct census: <math>28 + 4 = 32</math>) — documented in full; verdict by the frozen [C-3] logic (Hermiticity failure <math>\Rightarrow</math> UNDECIDED). [C] CONTRACT PRECISION (iii), prose only: “gauge-invariant subalgebra” at the free level means the GSO/fermion-parity <math>\mathbb{Z}_2</math> — the only <math>\theta</math>-compatible part of the <math>\mu_4</math> tower (the free-fermion shadow of the <math>E_8</math> glue: <math>(E_8)_1 =</math> even NS of <math>SO(16)_1 + \text{R spinor}</math>); the clock is the euclidean rotation itself (timelike), its equivariant statement moves to <math>\beta_2</math> (OS quotient first, then the clock as reconstructed transfer operator). [O] <math>\beta_1</math> proper stays open via <math>\beta_2</math>; WOIT.OS.TWISTOR.01 stays [O]; no marker moves. [E][C][O]</p> |

| Script                                | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v523_celestial_<br>wp5e_wm_derived.py | <p>CELEST.WP5E.WM.01: the constructive derivation of the <math>w_m</math> normalisation — “<math>1/\det_j</math> is the Atiyah–Bott / zeta-determinant fixed-point factor, COMPUTED from three independent sources”, closing the residual [O] of v516/v520 at the fibre-zero-mode level (verdict ERFOLG per the frozen preregistration). [E] ATIYAH–BOTT (route i): the equivariant mode ledger of the fibre <math>\mathbb{C}^2</math> equals the closed form <math>1/((1 - q i^j)(1 - q i^{-j}))</math> exactly in <math>\mathbb{Q}(i)</math> for all <math>n \leq 120</math>; REGULAR at <math>q = 1</math> with Abel value <math>(1/2, 1/4, 1/2) = 1/\det_j</math>, <math>\det_j = \det(1 - g^j) = (2, 4, 2)</math>; <math>(C, 2)</math> Cesaro convergence in exact arithmetic; the fixed-point factor splits off EXACTLY at every truncation level <math>d \in \{7, 12, 25\}</math>, for the phased (skeleton) AND the v520-forced unphased (completion) trace alike — the Abel-limit contact<math>_j = (Q^{(0)} - Q^{(j)})/\det_j</math> is the v516 contact vector COMPUTED, not declared. [E] ZETA/QUILLEN (routes ii/iii): <math>\det_\zeta</math> of the <math>g^j</math>-twisted circle Laplacian <math>= 4 \sin^2(\pi j/4) = \det_j</math> EXACTLY (Lerch + reflection formula symbolically; Hurwitz certificates <math>\sim 10^{-41}</math>); Quillen split <math>\det \Delta = \det_j^2</math>, <math> \det \bar{\partial}  = \det_j</math>, with the real positive holomorphic section UNIQUE via the <math>SU(2)</math> conjugation pairing; the <math>\delta_{1f} f_1 f_3</math> block at the <math>(0, b)</math> nodes carries the exact constant term <math>1/\det_b</math> (deviations <math>\leq 5.2 \times 10^{-28}</math>). [E] CONSISTENCY CHAIN: the derived weight reproduces the v516 chain number by number — <math>w_m = (0, \frac{3}{2}, 2, \frac{3}{2}) = 4h_m =  \mu_4 h_m = -4 \text{ch}_2(T_m)</math>; <math>T_5 = 0</math> at every scale; <math>h_2 : h_1 = 4 : 3</math>; the <math>T_3</math> budget <math>32 - 8c</math> forces <math>c = 4 =  \mu_4 </math> uniquely; per-sector Okubo squares <math>(18, 9, 18)\langle x, x \rangle^2</math>; total <math>45\langle x, x \rangle^2 = \frac{5}{4} \times 36\langle x, x \rangle^2</math>; <math>\Phi_{T_3} : 32 \rightarrow 0</math>, <math>\Phi_P : 72 \rightarrow 0</math>; <math>\psi(A_{\text{fix}}) = +64</math>, <math>\psi(\text{contact}) = -64</math>. [E] NEGATIVE CONTROLS: <math>1/\det^2</math> gives <math>w' = (0, 5/8, 1, 5/8)</math> with leftovers <math>(2, 12)</math> and a Quillen contradiction; <math>1/ 1 - i^j </math> gives <math>w''_1 = 1 + \sqrt{2} \notin \mathbb{Q}</math>; the <math>\mathbb{Z}_2</math>/Eguchi–Hanson anchor PASSES with the same derivation (<math>\det = 4</math>, <math>w = 1/2 =  \mathbb{Z}_2 h^{A_1}</math>, <math>9\langle x, x \rangle^2 = \frac{1}{4} \times 36</math>, <math>c = 2 =  \mathbb{Z}_2 </math>); the <math>SO(16)/D_8</math> KILL fires; <math>\text{diag}(i, i)</math> breaks the zeta = AB identity itself; <math>k = 3, 5</math>: <math>w_m = m(k - m)/2 = k h_m</math> — the weights wander correctly with the centre count, only <math>k = 4</math> carries the <math>E_8</math>-glue chain. [C] TYPED PREMISES (the mandatory fence): TP-REG (Abel/Cesaro/zeta regularisation IS the definition of the equivariant character), TP-Q (Quillen structure of BCOV <math>F_1 = \text{v520 TP-4}</math>), TP-NUM (unphased numerator = the v520 ERFOLG-A decision layer), TP-CH (the insertion channel <math>(0, j)</math> computes the box-channel weight). [O] the GLOBAL BCOV integral on <math>\mathbb{P}^1/\mathbb{Z}_4</math> beyond the fibre zero-mode factor; the resolved-ALE route (v514/v517) not built; SEAM.EQUIV.TWISTOR.01 untouched. NO marker moves. [E][C][O]</p> |

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v524_woit_beta2_os_quotient.py | <p>WOIT.BETA2.OS.01: the WOIT-<math>\beta_2</math> milestone of the OS twistor bridge</p> <p>WOIT.OS.TWISTOR.01 executed — “the OS quotient of the free system made explicit” (verdict SUCCESS per the frozen preregistration, [C]-typed per contract precision (iii)). [E] <math>\mathcal{H}_{\text{phys}}</math> EXPLICIT: <math>N = 16</math> (<math>\deg \leq 2</math>): the <math>37 \times 37</math> bond-cut OS Gram is exactly Hermitian, parity-block-diagonal, inertia <math>(37, 0, 0)</math> PD (min eigenvalue <math>1.7801 \times 10^{-6}</math> at 40 digits), null space <math>\{0\}</math>, <math>\dim 37 = 29 \oplus 8</math>; <math>N = 8</math> (complete half algebra): <math>(16, 0, 0)</math> PD (min <math>3.3471 \times 10^{-3}</math>), <math>\dim 16 = 8 \oplus 8 = 4^2</math> — compact euclidean time reconstructs a THERMAL (KMS) representation; exact certificate <math>\sin^2(3\pi/8) - \sin(\pi/8)\sin(5\pi/8) = 1/2</math>. [E] TRANSFER SEMIGROUP (Klein–Landau): <math>\tau_k</math> exactly Hermitian on all domains (<math>k = 1..7</math>, dims <math>29, 22, 16, 11, 7, 4, 2</math>), chain identities exact, vacuum fixed; the positivity pattern IS the site/bond dichotomy: even <math>k</math> PSD via the exact square identity <math>T(2j) = A_j^* A_j</math> (<math>(22, 0, 0)/(11, 0, 0)/(4, 0, 0)</math>), odd <math>k</math> indefinite (<math>(10, 12, 7)/(5, 6, 5)/(2, 2, 3)</math>) — the one-step transfer is NOT positive (the free chirality datum, kill-test-3 shadow sharpened), its even powers ARE. [E] THE CLOCK = <math>T^{N/4}</math>: <math>N = 16</math>: <math>\tau_4</math> PD <math>(11, 0, 0)</math> (min <math>6.6821 \times 10^{-5}</math>), compressed spectrum <math>[0.0194517, 1.64144]</math>, vacuum eigenvalue exactly 1; <math>N = 8</math>: spectrum EXACTLY <math>\{1, \sqrt{2} - 1\} = \{1, 1/\delta_S\}</math> in both parity sectors — the silver axes of the v519 <math>\mu_4</math> torsor return as the clock-transfer eigenvalue; spectral projections <math>\sim 10^{-40}</math>; the reconstructed rotation group <math>U(s) = e^{isH}</math> is unitary with the group law. [E] v522 RESOLUTION: the census <math>(745, 96, 0)</math> reproduced; EVERY anti-matching entry is a wrap overlap, every overlap-free entry matches — the pre-quotient non-Hermiticity is EXACTLY the domain/wrap artifact; on the quotient the clock has spectral calculus. Pre-registered KMS deviation: NO contraction on the compact circle (edge modes <math>C(1)/C(3) = 1 + \sqrt{2} = \delta_S</math> exactly, <math>\det(G - \tau_4) &lt; 0</math>). [E] GSO/<math>\Theta</math>: the grading survives; the perpendicular torsor mirror descends anti-unitarily (<math>\eta_\perp \in \{\pm i\}</math>), <math>\Theta_{\text{phys}}^2 = +1</math> on every sector (Kramers-free), <math>\theta_{\text{cut}} \circ \theta_\perp = \alpha_{N/2}</math> exactly. [E] CONTROLS: site cut indefinite <math>((3, 3, 1)/(2, 2, 4))</math> — the contract kill branch fires there; family A <math>(4, 4, 0)</math>; anti-chiral <math>(8, 8, 0)</math> no quotient; wrong direction non-Hermitian (mismatches all wrap-overlap). KILL-TEST BOOKKEEPING: (1), (2) strengthened, (3) shadow sharpened, none fires; (4)–(7) untouched; all seven stay live on <math>\mathcal{A}_{\text{hol}}</math>. [C] FENCE: “the clock acting unitarily” is operationalised per contract precision (iii) as the reconstructed transfer/rotation structure. TRANSPARENCY: run 1 scored 18/20 (a sympy simplify failure on a TRUE <math>\pi/16</math> product formula, fixed by a Laurent-polynomial certificate; no criterion changed). [O] <math>\beta_3</math> is the next milestone; WOIT.OS.TWISTOR.01 stays [O]; no marker moves. [E][C][O]</p> |

|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v525_seam_bit_twist_blind.py           | <p>SEAM.BIT.TWISTBLIND.01: the twist-state attack on the alignment bit DECIDED — “mark-decorated states do not see <math>\delta</math>”, an honest, decided NEGATIVE result (v508 style): the NINTH side-blind test on the v512 scoreboard (<math>8 \rightarrow 9</math>); the free-plus-twist class (everything Wick-computable) is EXHAUSTED. [E] ALL LIFTINGS WELL-DEFINED AND BLIND: (a) <math>\sigma</math>-gauge arc decoration (<math>\mathbb{Z}_2</math>): <math>\sigma \circ r = \sigma</math> on the swap axes makes the twisted Gram a diagonal unitary congruence <math>DMD</math> — spectra IDENTICAL to untwisted (dev 0.0); (b) Kadanoff–Ceva 4-twist insertion <math>\omega(D \cdot)/\omega(D)</math>: well-defined on <math>N = 32</math> (<math>\omega(D)</math> real nonzero; the <math>N = 16</math> odd-<math>m</math> degeneration is the <math>C(\text{even}) = 0</math> checkerboard artifact); the RP SPECTRA depend on <math>\delta</math> for the first time in the program (pairwise up to 1.05), but the INERTIA is (16, 0, 0) PD with the SAME <math>\eta = +i</math> for every <math>m</math> — the decoration sees <math>\delta</math>, positivity does not; (c) the <math>\mu_4</math> twist at <math>\beta = \pi/2</math> is pure plane gauge; (c') genuine Bogoliubov defect <math>\beta = \pi/4</math>: <math>\Theta</math>-compatibility selects exactly 2 of 16 sign patterns (NS-wrap forced), the winner genuinely non-monomial — still PD, spectra identical. STRUCTURE THEOREM (empirical, mechanism exact): EVERY <math>\Theta</math>-compatible quasi-free mark decoration is RP-spectrally INVISIBLE (the defect planes never straddle a cut bond; orthogonal congruence). [E] SUB-RESULTS: the defect energy <math>E_{\text{def}} = 1.2752872</math> for EVERY <math>m</math> (spread <math>4 \times 10^{-40}</math>) — <math>\delta</math>-blind; the 4-twist Casimir <math>\ln  \omega(D) </math> measures <math>\delta</math> (<math>-0.890 \dots -1.348</math>) but is exactly mirror-symmetric under <math>m \leftrightarrow 8 - m</math> — a family gauge, never a side selector; Kramers <math>\langle \Gamma \rangle_{\text{tw}} = +1</math> for every <math>m</math>. [E] TWO BIT-PRESUPPOSING <math>\pi/2</math> STRUCTURES (the harvest): the <math>\eta</math> flip <math>+i \rightarrow -i</math> on the mark-fixing axes (<math>\sigma \circ r = -\sigma</math>, odd sector exactly negated); the twist frustration of the mark-fixing mirror ((4, 4, 0) indefinite for both <math>\eta</math> — the lattice shadow of the Ising twist field's mirror-oddness) — both formulable ONLY on the fixing axes existing iff <math>\delta = \pi/2</math>: they PRESUPPOSE the bit (v512 facet class), no selector. [E] NEGATIVE CONTROLS: the twist-free limit = v519/v521 exactly; the site cut keeps failing in every decorated state; the v512 counterwitness is arc-equivalent at <math>N = 16</math> to the blind member <math>\pi/4</math> — no state-level selector can exclude it; a single twist has <math>\omega(D) = 0</math> identically (twists exist only in mark pairs); the deck-paired FOUR-twist decoration is the minimal well-defined one. [O] the door narrows to a genuinely INTERACTING <math>\mathcal{A}_{\text{hol}}</math> whose OS data are NOT Pfaffian-reducible to the chiral vacuum — beyond every Wick-computable class. VERDICT: KILL exactly as preregistered; the alignment bit remains genuine discrete input; no marker moves. [E][C][O]</p> |
| v526_seam_thermal_kms_nariai_bridge.py | <p>SEAM.THERMAL.KMS.01: the thermal seam — KMS of the reconstructed free OS quotient CLOSED onto the Nariai/BH temperature chain (the THIRD LEG of <math>c_3</math>). Verdict SUCCESS. [E] <math>\beta</math> MEASURED = <math>N</math> at both levels (<math>N = 8</math>: <math>\omega = \text{arcsinh}(2^{-3/4})</math>, <math>\kappa = q^{-8}</math> exact; <math>N = 16</math>: pairing exponent <math>(N/2) + 1 = 9</math>); <math>T_{\text{seam}} = 1/N</math> per clock step, <math>\beta_{\text{angle}} = 2\pi</math> EXACT = <math>1/(4c_3)</math>, <math>T_{\text{seam}} = 4c_3 =</math> Bisognano–Wichmann/Hawking normalisation (v208); modular Hamiltonian closed (<math>\nu_1 = \cos(\pi/24)</math>, <math>\nu_2 = \cos(7\pi/24)</math>; Tomita KMS-<math>\beta = 1</math> on all 256 pairs); <math>c_3</math> third leg class-1 selected; entropy <math>S(8/16/32) = 0.52187/0.63510/0.75006</math>, <math>\Delta S/\ln 2 \rightarrow 1/6</math>, horizon fractions do NOT transfer; [C] silver = <math>C(3)/C(1)</math> thermal kernel ratio; non-compact <math>\Rightarrow T = 0</math>. | Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v569_lambda_pencil_onemode.py | The relative pencil $Z = B^{-1}S$ on the declared Paper-II surface: the pencil identities are machine-tight on all 70 frame-A windows (worst residual $2 \times 10^{-14}$ ); the LOCKING mode is $\lambda_2$ hugging 1 (median 1.000021) while the spectator $\lambda_1$ stays uniformly separated — $\min  1 - \lambda_1  = 3.53$ , $\lambda_1 \in [4.53, 180.64]$ , always ABOVE 1: the two-dimensional cancellation reduces to the SINGLE scalar $1 - \lambda_2$ on the whole reachable surface (verdict ONE-MODE); the $h = 540$ reference window reads $1 - \lambda_2 = -2.27 \times 10^{-5}$ (reproducing $\det \hat{A} = 4.22 \times 10^{-3}$ ), and the position scramble explodes $ 1 - \lambda_2 $ by $\times 1.9 \times 10^6$ while the identities keep holding — the locking is arithmetic placement; declared surface only, no uniformity/rate/RH, Problem 7.1 typed not bounded [E]     |
| v570_separation_floor.py      | The v569 open question reduced and certified on the declared surface: two one-line theorems ( $P = \det S / \det B > 0$ , $T = \text{tr } Z > 0 \Rightarrow \lambda_1 \geq \sqrt{P}$ ; $P \leq 0 \Rightarrow \lambda_1 \geq T$ ) turn the spectator separation into a closed per-window floor — $\min F = 2.130 \geq 1.05$ on ALL 70 windows: the separation follows from $\det S / \det B$ and $\text{tr } Z$ alone; the dominance $P \in [4.5, 120.6]$ grows with depth ( $h^{0.90}$ , surface ladder), $1 - T + P = \det(B - S) / \det B$ links the two scalars exactly, and the cheap witness route is honestly killed (negative pair mass up to $13.7 \times \det S$ ; best single pair $0.13\text{--}0.34 \times \det B$ ) — the $h$ -uniform question is typed as pair-level size-vs-cancellation; scramble flips $\text{tr } Z$ to $-78.3$ ; declared surface only, Problem 7.1 untouched [E] |
| v571_cr_discrete_corners.py   | The preregistered cross-ratio check, discrete half executed: the corners $J, K, C, F = M(1, t)$ ( $t = -2..1$ , $\det s(2, 4, 14, 32)$ ) read $(26, 35, 44, 53)$ under the declared Koide functional $\ell(M) = a^T M \mathbf{1}$ — CR = $4/3$ exactly, and $y_F = 53$ is Möbius-forced by the three upstream corners (fit-free); $\ell$ is affine on the path (step $9 = N_{\text{fam}}^2$ ; every linear functional passes — stated honestly); negative controls: determinants $28/25$ , dominant eigenvalue $1.3222$ ; the continuous solver states stay open per CONTRACT.F.01 [E][C]                                                                                                                                                                                                                                                                                                             |
| v572_rp_bit_form.py           | The RP form on the 81-twins: spectrally blind (identical inertia for every declared state; never PSD — no kinematic positivity selection, honest negative) but integrally ANCHOR-VISIBLE — the Smith towers of the anchor-state Gram separate the twins in one slot (18 vs 2, a factor $9 = N_{\text{fam}}^2$ ; ladder state identical, anonymous states blind); trace discriminant $-81^2$ on both; blindness robust under the compiler $V$ -flow, but the anchor-Hamiltonian GIBBS PENCIL separates: the compiler twin is Gibbs-critical at $s^* = (8 - 4\sqrt{19})/15$ ( $\det$ constant $81^2$ ), the alt never — a rank-drop marker whose critical mode is the seam-row, sheet-flow-fixed direction (the $A_2$ -Ext carrier); the positivity selection stays open [E]                                                                                                                            |
| v573_pair_band_structure.py   | The pair-band anatomy of the dominance: every near band ( $< 16$ lag cells) and the diagonal drag NEGATIVE on the declared subset; the whole positive excess lives beyond 16 cells with stable net ( $\text{far}/\det S \in [1.55, 1.91]$ , gross growing $4.1 \rightarrow 13.0\times$ ); the scramble explodes $\det S \times 49$ and collapses the far share — long-range coherence, arithmetic placement; sharper: scale-locked ( $\geq h/2$ ), weight-concentrated (top decile nets $0.85\text{--}1.00 \times \det S$ ), phase-flat — the target is heavy-pair window-scale coherence [E]                                                                                                                                                                                                                                                                                                         |

*continued on next page*

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v574_stageb_winding.py        | Stage B, first narrowing: the involution TYPE is forced (rank theorem — a 2-dim-positive involution cannot carry the binary trace code), ( $E$ ) bounds $N \leq 3$ , the ladder self-consistency selects one member per $N$ , and $\text{sat} = N^4$ holds ONLY at $N = 3$ ( $32 \neq 1$ , $512 \neq 16$ , $81 = 3^4$ ): the double self-consistency pins $(N, Q) = (3, \text{compiler } Q)$ — $N_{\text{fam}} = 3$ relocates from declared to consistency-forced; spectrum ablation: the surviving family is exactly $\{1, 2, N\}$ with the compiler shape — the self-consistency forces the sheet block, ( $E$ ) contributes $N = 3$ ; redundancy: ( $M$ ) and ( $L$ ) fall relative to the self-code demands (class 1274, compiler $Q$ still unique) — the maximal ablation drops ( $E$ ) too — winding column + integrality + self-code pin the compiler alone; declared: involution existence, the winding UNIFORMITY (without it a four-column family survives, exactly one uniform — the compiler), $N_{\text{fam}} = 3$ (E8-glue); GATE.QGEO.01 narrowed by five items, not closed, no P2 reduction [E][C] |
| v575_cr_continuous_uniflow.py | The continuous half of the cross-ratio check, executed: the native exports $\{(2/3)^6, (2/3)^6, 1, -7\}$ are forced degenerate by the single-flow theorem (v425), and a repeated quadruple gives $\text{CR} \in \{0, 1, \infty\}$ in every assignment — never $4/3$ : the continuous half closes onto the single-flow reduction; the anchors stay [O] walls, the discrete half (v571) carries the content [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| v576_cheb_loewner_edge.py     | The Chebyshev-Loewner edge structure: the polarized cross-weight formula exact (symbolic $N \leq 11 + 10^{-11}$ surface); the edge read $w_{N-s}^{(ij)} = -(2/N) \sin \omega_i \sin \omega_j U_{s-1}[x_i, x_j]$ is a scaled Loewner matrix (rank $\leq s-1$ ; $s=2$ rank one by theorem); the leading profile's Lorentz image is the null triple $(5, -3, 4)$ — Euclid's parametrisation, typed compression with $(g_{\text{car}}, N_{\text{fam}},  \mu_4 )$ ; the edge defect $-(3\pi^4/175)(s^2-4)(11s^2+6)N^{-4}$ exact (series); the pair polynomial $P(s, z)$ with $P(2, 3) = 0$ and sign transition $s/z \approx 0.503/1.987$ — the analytic prototype of the v573 pattern; macro kernels verified; edge regime closed, macro/transition open, Problem 7.1 untouched [E][C]                                                                                                                                                                                                                                                                                                                                  |
| v577_nullray_census.py        | The null-ray locking census: the locking mode aligns with $(2, -1)$ at $23.5\text{--}33.8^\circ$ on all 70 windows (below random), declines slowly ( $h^{-0.10}$ — the clean success bar honestly not met), and the scramble destroys the alignment ( $+21^\circ$ ): a real partial carrier; the macro regime bends the direction — follow-up is $K_\infty$ , not more angle fits [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v578_native_jets.py           | The jet contract executed natively: the seam flow has $\{q, t\} = -\Delta^2/2$ exactly (Moebius in its own clock $u = e^{\Delta t}$ ), the 1-loop QCD flow has Schwarzian 0 in its own RG time — no shared wall-time jet invariant; each instance projective in its own clock, the obstruction is the clock; external anchor-level jets remain the future test [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| v579_macro_kernel_signs.py    | The two-scale kernel signs: sign $K_\infty(\sigma, \tau)$ matches the real surface on every resolved cell (332/332 at $h = 300$ ); the diagonal $\det W^\infty(\sigma)$ is negative on $\sim 72\%$ of $(0, 1)$ — same-scale pairs couple negative analytically; the geometric half of Regime B closes, the $\Lambda$ -weighted arithmetic stays open [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| v580_occupation_map.py        | The arithmetic occupation map: $\det S = (1/2) \sum c_{at}(d_1) c_{at}(d_2) D(W(d_1), W(d_2))$ exact (lag-side polarization identity); every significant cell sign-matches $K_\infty$ on every tested window — the primes populate the geometric sign map, the open Regime-B content is the amounts; mid-diagonal negative, cross-scale positive; scramble control clean [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| v581_locking_transport.py     | The multilevel transport lemma, measured and killed: 40 doubling pairs, drift $0.3\text{--}6.7^\circ$ per octave (median $2.35^\circ$ ) but GROWING ( $h^{+0.36}$ vs the bar $h^{-1-\delta}$ ) — not summable, the review's own kill fires; any future transport must carry the window-dependent macro direction [E][C]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*continued on next page*

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v582_density_dominance.py    | The dominance is DENSITY-DRIVEN: the smoothed comb reproduces $\det S$ to 99.8–99.9% (2% window) on every regular window through the exact lag-side identity; the scrambled control captures only 70% — the real comb is anomalously smooth at these scales; the $h$ -uniform dominance question relocates to PNT-level regularity of the smooth density functional (closed-form bound = the named next step); boundary window $h = 1292$ named [E][C]        |
| v583_pnt_model.py            | The smooth density functional in closed, PRIME-FREE form: the two-term classical law $\text{mass}(u) = 4e^{u/2} - 2(\zeta'/\zeta)(1/2)$ (pole term + $s = 1/2$ constant, no zeros) reproduces $\det S$ on all 69 regular windows parameter-free to 1.016–1.143; the anomalous $h = 1292$ sign flip is genuine prime-fluctuation content; the $h$ -uniform dominance splits into a prime-free two-integral inequality plus a zero-oscillation bound [E][C]     |
| v584_ext_source_response.py  | The interacting follow-up of v572: rank-one Ext-source coupling on the Gibbs pencil separates the 81-twins directionally inside the unit coupling box – exact rational flip thresholds whose numerators are the v572 pencil factors; positive coupling $J \leq 15/16 < 1$ heals exactly the compiler twin, the alt twin is rigid; the response pole sits on the golden polynomial $s^2 - s - 1$ ; a response-level selection, not a positivity theorem [E][C] |
| v585_pnt_locking_split.py    | The two-layer split of the locking cancellation: the v583 prime-free model misses the Paper-II defect by 2–4 orders (median $1350\times$ , growing $h^{1.08}$ ) while reproducing $\det S$ – the dominance is density, the locking depth is the primes; layers $h^{-1.43}$ (density, positive) $\times h^{-1.08}$ (arithmetic, with deep-window sign overshoots at $h = 1219, 1445$ ) $= h^{-2.51}$ real; the 7.1 budget splits accordingly [E][C]            |
| v586_pnt_lock_direction.py   | The locking direction is density-determined: the real locking eigenvector agrees with the prime-free model to $0.03^\circ$ (median; max $0.33^\circ$ , decaying $h^{-1.16}$ ) while the depth differs by $1350\times$ – the primes are a pure depth amplifier along a density-fixed direction; the deterministic direction certifies the real defect within a factor $\leq 2.9$ ; resolves the v577 comparator artifact; scramble must-break fires [E][C]     |
| v587_w_closed_form.py        | The diagonal companion of the v576 cross formula: the corpus diagonal lag weight is the single closed expression $W_{kk}(d) = (2/N)[(N-1-d)\cos(w_k d) + \sin(w_k(d+1))/\sin(w_k)]$ (machine-exact); the exact cell-sum reproduces the prime-free model's entries and determinant to 0.03% – the S-side of the deterministic layer is closed-form; the v579 kernel is its edge-anchored version identically [E]                                               |
| v588_closed_delta.py         | The deterministic layer of Problem 7.1 in closed form: one exact function $G_{ij}(\beta) = \sum_d e^{-\beta d} W_{ij}(d)$ carries both sides – the pole exponent ( $S$ ) against the trivial-zero ladder ( $B$ ); closed $B$ to $2 \times 10^{-5}$ , the closed defect matches the density layer to 0.2% on all 70 windows with census decay $h^{-1.40}$ ; the remaining step for a theorem is elementary asymptotics [E][C]                                  |
| v589_zero_comb.py            | The arithmetic layer is the zeta-zero comb: the atom table's residual oscillation matches the explicit-formula comb (correlation 0.82, slope 1.28 with 200 damped zeros; pointwise at low $u$ ); the comb recovers a factor 5.7 of the lock depth at the smallest window ( $176 \rightarrow 31$ ), deep windows out of reach – the zero-oscillation bound is a quantified explicit-formula target; no bound claimed [E][C]                                    |
| v590_involution_existence.py | The sheet-involution existence of GATE.QGEO.01: the integral $V$ -commuting involutions are exactly the spectral sign group $(\mathbb{Z}/2)^3$ on both twins (rigidity); the v574 type theorem, seam reversal and zero-mode fixing single out $S_0$ uniquely with exact $\Sigma$ -signature – existence is unconditional; the two demands' continuum derivation stays the named open [E][C]                                                                   |
| v591_pole_rank_one.py        | The pole term is exactly rank-one: $S^{\text{pole}} = -32\pi^2 a e^a g g^T$ with $g_k = k/(a^2 + 4\pi^2 k^2)$ , $\det \equiv 0$ ; the locking direction obeys $v_2/v_1 = -(a^2 + 16\pi^2)/(2(a^2 + 4\pi^2))$ with limit exactly $-1/2$ (the null ray, deriving the v577 conjecture) and matches the measured directions to 0.04–1.4% [E][C]                                                                                                                   |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v592_continuum_det_<br>law.py  | The continuum determinant law: $\det S(a)$ closed with the $e^{2a}$ coefficient identically zero and exact leading law $640\pi^2 e^a/a^3$ ; the real dominance tracks the closed formula at correlation 0.9985 (the closed-form origin of the v570 growth); finite-N gap typed; entry-level arithmetic certificate with margin $47.6\times$ conditional on the measured oscillation sup [E][C]                                                                                                                       |
| v593_cutoff_<br>completion.py  | The cutoff completes the closed entries: with the $\sigma_0$ cutoff the closed forms match the model entries to 0.7–1% and the determinant to 0.2–1% (v592's continuum-without-cutoff captured only 0.19–0.50); the density layer is closed end-to-end with an $O(1/N^2)$ residual [E][C]                                                                                                                                                                                                                            |
| v594_unconditional_<br>cert.py | The entry-level arithmetic layer is bounded unconditionally: partial summation plus the published bound $ \psi(x) - x  < 0.94\sqrt{x}$ (Büthe 2018) give $\sup  \text{Osc}  \leq 17.4$ on the declared surface; the certificate holds with margin $565\times$ – the first unconditional statement of the program; the determinant level stays open [E][C]                                                                                                                                                            |
| v595_mapping_<br>completion.py | The residual bookkeeping executed: the v593 residual was the $\sigma$ mapping – with the exact dictionary ( $a_{\text{eff}} = ND/2$ , limits $[u_0/(ND), 2\alpha/(ND)]$ ) the closed forms match entries and determinant to 1.00000–1.00017; kernel piece $9 \times 10^{-6}$ ; honest amendment of the v593 attribution; the density layer closed at identity level; det law formalized in Lean [E][C]                                                                                                               |
| v596_lock_<br>projection.py    | The 1D reduction of the arithmetic layer: along the closed v591 direction the zero functional cancels the closed density value to median $7.7 \times 10^{-4}$ (decay $h^{-1.01}$ ); the coupling spectrum is collective (max share 5.9%, $N_{50} = 56$ ); scramble breaks by six orders; the remaining arithmetic statement is an equidistribution-type theorem for one explicit family of identities [E][C]                                                                                                         |
| v597_mu4_cover_<br>model.py    | Strategy I/II first step: the $\mu_3$ -cover $y^3 = x^4 - 1$ carries four compiler fingerprints – rank-3 Eisenstein module, projective $D_4$ via the deck ( $r^4 = \omega$ ), cusp-class group $(\mathbb{Z}/3)^4$ of order 81, and the unique invariant hermitian form of Lorentz signature (1, 2) matching Chevalley–Weil and Paper II; the $Q/V$ dictionary stays the named open [E][C]                                                                                                                            |
| v598_cover_<br>dictionary.py   | The cover dictionary, round 2: three compiler objects located exactly – $U \sim G_2$ , $Q_- \sim G_1 - G_3$ (the sheet coupling as the diamond-diagonal Gram difference), the binary ladder $\sim 1 + G_1 + G_3$ ; opposite-twist products nilpotent; the grading half absent from 7296 scanned canonical combinations (kill not triggered; the real structure is the named suspect) [E][C]                                                                                                                          |
| v599_real_<br>structure.py     | The real structure on the $\mu_3$ -cover: the anti-holomorphic $D_4$ reflection constructed exactly ( $R$ unique up to scale, $R^2 = +1$ , four twist intertwinings); the grading functor closes the three v598 dictionary gaps at char level ( $V, H$ with the anchor spectrum (1, 1, 2), $Q_+$ ); the $\Gamma$ -decomposition carries 5, 9, 27; the joint embedding stays open (quantified negative); the invariant form has $\det J = 8$ and Lorentz signature (1, 2) [E][C]                                      |
| v600_joint_<br>embedding.py    | The joint embedding: the compiler pair $(U, V)$ realized on the $\mu_3$ -cover as a $\Gamma$ -even degree-2 pair — $\mathbb{Z}[\omega]$ -integral, seven-word rank 7, simultaneous conjugation to the compiler pair solved exactly, integer restrictions on the saturated $\text{Fix}(R)$ lattice, and saturation index $81 = 3^4$ with the exact v566 divisor pattern (1, 1, 1, 3, 3, 3, 3); canonicity typed open [E][C]                                                                                           |
| v601_equivariant_<br>dual.py   | The canonical equivariant realization: the J-adapted cusp projectors rotate exactly under $D_4$ ; the pair family $U_k = 3GJ_k$ , $V_k = 1 + GJ_{k-1} - GJ_kGJ_{k+1}$ is $\mathbb{Z}[\omega]$ -integral, compiler-exact and equivariant by construction (mark choice = winding choice); it realizes the DUAL parabolic exactly (conjugate to the transposed pair; the direct intertwiner is singular), and the v590 Klein four-group lives integrally on the curve; the Weil-twisted RP comparison stays open [E][C] |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v602_duality_forms.py            | The duality-and-forms round: the J-adjoint exchanges the two parabolic types inside one equivariant structure; the dictionary completes in the J-projector language (the corpus anchor formula $H = 1 + V(V - 1)/2$ holds verbatim); Weil positivity holds exactly ( $JC$ positive definite, the Riemann bilinear relations on the $\omega$ -sheet); the canonical bilinear form $B = M^\dagger J$ is symmetric with $\det B = 8$ ; the corpus-transpose and mark-local questions typed open; Lean certificate FORM.QGEO.04 [E][C]                           |
| v603_seam_marks.py               | The seam-and-marks round: the seam line is a REAL line of the cover (unique common eigenline, R-fixed, $S_0$ -reversed — the v590 seam-reversal demand geometric); the infinity cusp separates in the unreduced Burau module; the first per-mark $\mathbb{Z}/3$ witness lands ( $E_1$ , class order 3 in the word-order cokernel); the corpus-transpose translator negatives quantified [E][C]                                                                                                                                                               |
| v604_equivariant_order.py        | The equivariant order and the infinity bridge: $R$ IS an anti-isometry ( $M^\dagger JM = J^T$ exact; correction of a diary side remark), $J$ restricts to the integer form $J_{\text{fix}}$ with $\det = 72$ ; the four mark frames generate a FULL order of index $27 = 3^3$ in $M_3(\mathbb{Z}[\omega])$ ; the 3-torsion localizes at infinity ( $\text{coker}(1 - T_\infty) = \mathbb{Z}^2 \oplus (\mathbb{Z}/3)^3$ , finite cusps torsion-free): 81 at the marks, 27 at infinity; translator negatives extended (the $\bar{\omega}$ -sheet named) [E][C] |
| v605_translator.py               | The translator round: the corpus RP anti-automorphism IS the J-adjoint twisted by an explicit inner element $c$ ( $\varphi(A) = cAc^{-1}$ exact, intertwiner space 1-dim, 14c integral over $\mathbb{Z}[\omega]$ ); the seam is a NONZERO pure 3-torsion class at infinity (torsion coords $(2, 2, 0)$ ); the 81 survives frame-joining as the saturation defect (chain indices $3^5, 3^4$ ); the $J_{\text{fix}}$ duality certified with a Lean addendum [E][C]                                                                                             |
| v606_mode_separation.py          | The mode-separation round: all three $V$ -eigenlines lift to PURE 3-torsion classes at infinity with PAIRWISE DISTINCT classes (the selection carrier the real structure could not provide; the canonical '+1' rule stays open); and the cubic field of the translator element has discriminant $-783 = -3^3 \cdot 29$ , Galois $S_3$ — no cyclotomic identity for $c$ (honest negative) [E][C]                                                                                                                                                              |
| v607_selection_rule.py           | The selection rule: the infinity torsion is a genuine $\mathbb{F}_3$ space, the deck rotation acts with char $(x + 1)(x^2 + 1) \bmod 3$ ( $x^2 + 1$ irreducible) — EXACTLY ONE projective eigenline, and it IS the top mode; the three modes carry mutually exclusive canonical labels (seam = $R$ -real, top = deck-eigen, zero = unlabeled) and $S_0$ flips exactly the labeled pair: both v590 demands expressed through cover structure [E][C]                                                                                                           |
| v608_gamma_free_slice.py         | The free gamma slice: mirror modes are STRICTLY OS-negative (the anti-chiral odd sector is negative definite — no mirror survives reconstruction, kill test 3 cannot fire at the free level); the chiral generation is multiplicity-free (clock spectrum $\{1, \sqrt{2} - 1\}$ ); and the mark transport exists ( $\tau_2$ is the mark-A→B transport, PD) — kill test 7 does not fire at the free level; the gamma milestone stays open on $\mathcal{A}_{\text{hol}}$ [E][C]                                                                                 |
| v609_translator_factorization.py | The translator factorization: the mirror intertwiner $d$ ( $dA = \Gamma(A)d$ ) is UNIQUE, unimodular, $\mathbb{Z}[\omega]$ -integral and $\Gamma$ -involutive ( $\Gamma(d)d = 1$ ); the v605 element factorizes exactly, $c = \lambda K_1 d$ with $K_1 = J^{-1} \overline{F_2}^T M^{-1}$ — $\theta_{\text{corpus}} = J \text{adj} \circ \text{inner}(K_1) \circ \text{inner}(d)$ : the geometric identity of $c$ is closed [E][C]                                                                                                                            |
| v610_curve_landscape.py          | The curve landscape: the Jacobian splits (differential characters of orders $(12, 12, 6)$ ) into a $\mathbb{Q}(\zeta_{12})$ -CM abelian surface — the field of deck AND marks — times the $\mathbb{Q}(\omega)$ -CM elliptic curve $E : y^3 = u^2 - 1$ ; point counts confirm the splitting ( $a_p(C) = a_p(E)$ for all tested $p \not\equiv 1 \bmod 12$ ); the integer-spectrum census honestly relativizes single-char hits (the anchor class is the most frequent nontrivial family; the compiler's distinction is the joint structure) [E][C]             |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v611_periods.py                | The periods round: the five basic period integrals are EXACT Beta values with all Gamma denominators on the $\zeta_{12}$ grid; the $\mu_4$ rotation acts on periods with the exact characters $i^{k+1}$ ; $\Omega_E = B(1/3, 1/6)/2$ exactly (the classical $\omega$ -CM period); the cross-factor ratio admits no low-degree integer relation (PSLQ) — the two CM factors are period-independent, as the v610 splitting demands [E][C]                                                                                                                                                                                                                                                                           |
| v612_polarization_frame.py     | The polarization frame: $r$ has three simple eigenvalues $\zeta_{12} \cdot \{1, -1, -i\}$ ; in the rotation eigenbasis $J$ becomes exactly diagonal with signature $(1, 2)$ , and THE UNIQUE POSITIVE (Hodge) DIRECTION IS THE PRIMITIVE $\zeta_{12}$ EIGENSPACE — the analytic Hodge structure and the finite rotation agree on where positivity lives; the canonical period normalization (Beta weights) is the named next step [E][C]                                                                                                                                                                                                                                                                          |
| v613_canonical_periods.py      | The canonical period normalization — the analytic bridge closes: the quarter rotation acts DECK-FREE on the four branch segments (12 wrap factors exactly 1); THE EXACT DICTIONARY $r = \text{deck} \circ \text{rotation}$ : $\text{char}(r) = \text{char}(\omega M)$ exactly, explaining $r^4 = \omega$ structurally; the period rows ( $\text{hol } dx/y^2$ , $\text{hol } x dx/y^2$ , $\text{antihol } dx/y$ ) realize the rotation eigenframe; the Hodge weights are explicit Gamma monomials (complex Beta formula, $h_1 = (3\sqrt{3}/16\pi)\Gamma(1/3)^2\Gamma(1/6)^2$ ); and $J = -h$ PER CHARACTER: the compiler polarization is minus the analytic Hodge form — Riemann–Hodge positivity realized [E][C] |
| v614_transport_deck.py         | The Gauss-Manin transport round — THE DECK STEP IS THE BOUNDARY MONODROMY: transporting the segment cycles along the rigid quarter-rotation loop, the discriminant $\lambda(\tau) = e^{2\pi i \tau}$ winds once and the periods factorize exactly; at $\tau = 1$ the deck factor is $\omega = t^4$ on every sheet (the exponent $4 =  \mu_4 $ forced by the puncture count); the canonical transport matrix is EXACTLY $\omega M$ — the v613 dictionary $r \sim \omega M$ is CANONICAL, and $(\omega M)^4 = \omega$ re-derives $r^4 = \omega$ [E][C]                                                                                                                                                              |
| v615_gamma_toy_interacting.py  | The interacting gamma slice at toy level: the gamma battery executed ON the RP-surviving interaction (the alignment bit, v534) — THE INTERACTING MIRROR FLIP: at the forced twist the mirror state’s odd sector is STRICTLY NEGATIVE DEFINITE on every cut and every coupling (kill test (3) cannot fire on the surviving class – v608 upgraded from $g = 0$ to the full grid); the mark transport exists interacting (kill test (7) does not fire); the odd transfer spectrum stays multiplicity-free; the dead member has no RP home: bit selection and chirality data CO-LOCATE [E][C]                                                                                                                         |
| v616_su2_internal_kinematic.py | The internal $SU(2)$ , kinematic separation at twistor level: Woit’s Euclidean structure IS the internal $j$ -direction ( $\rho_{\text{tw}} = \text{right-}j$ verbatim); the internal $\mathfrak{su}(2)$ preserves every twistor fiber, commutes exactly with the spacetime quaternion action and intersects it in $\{0\}$ — kill test (6)’s KINEMATIC branch does not fire; THE CLOCK FACTORIZES as left- $u$ right- $u$ exactly ( $u = e^{i\pi/4}$ : spacetime half-quarter $\times$ internal half-quarter), the ALE deck is purely spacetime-side, and the complex choice breaks the internal $SU(2)$ to $U(1)$ with the v519 mark torsor as its $\mu_4$ [E][C]                                                |
| v617_seam_cover_forcing.py     | The seam forcing round — THE CONFORMAL SEAM AXIOMS FORCE THE $\mu_3$ -COVER: $\mathbb{Z}_4$ -Möbius rigidity (every $\mathbb{Z}_4$ -cyclic configuration is Möbius-equivalent to $\mu_4$ ; harmonic cross-ratio orbit $\{2, 1/2, -1\}$ ), the weight census forces UNIFORM weights $j \in \{1, 2\}$ (the conjugate sheet pair), $j = 1$ gives $y^3 = x^4 - 1$ exactly with genus 3, and the seam reflections match the cover’s real structure (the v599 $(k, 5-k)$ pattern, the two v519 cut points); the bedrock residue narrows to the cyclic-3 choice and the physical $\leftrightarrow$ conformal seam identification [E][C]                                                                                  |
| v618_uniform_constant.py       | The uniform constant round — $C = 1$ FROZEN on the declared surface with the sharpened sign-flip dichotomy: on every lock-sign window (67 of 69) $ q_{\text{real}}/q_{\text{model}}  \cdot h \leq 1$ (measured max 0.982), tertile medians non-increasing; exactly TWO $q_{\text{real}}$ sign-flip windows and the violator set EQUALS the flip set exactly (honest correction of the diary note: the mechanism is the $q_{\text{real}}$ flip, $q_{\text{model}}$ never crosses zero); scramble breaks by $> 10^4$ [E][C]                                                                                                                                                                                         |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v619_flip_mechanics.py         | The flip mechanics round – the two $C = 1$ violators are TRUNCATION ARTIFACTS of the prime-data cap (the flip set equals the truncation set exactly; no zero resonance), REPRODUCED by injection into complete windows with matched sign and magnitude at both scales; on the complete-comb surface $C = 1$ holds with ZERO exceptions (max 0.982): the v618 dichotomy upgrades to a mechanism and the flip windows are retired [E][C]                                                                                                                                                                                                                                                                                                           |
| v620_cyclic_n_census.py        | The cyclic- $N$ census — the seam admits EXACTLY $N \in \{3, 5\}$ as primitive-Lorentz orders (full infinity ramification iff $\gcd(N, 4) = 1$ ; Chevalley–Weil signatures; $N = 6$ reduces to $N = 3$ ), and the compiler’s machine-checked integral constants ( $\det_{\mathbb{Z}}(1 - \text{deck}) = 27 = 3^3$ , saturation $81 = 3^4$ ) pin $N = 3$ UNIQUELY: the v617 bedrock residue (i) is now conditional on $N_{\text{fam}} = 3$ ( $E_8$ -anchored) [E][C]                                                                                                                                                                                                                                                                              |
| v621_interacting_semigroup.py  | The interacting Klein–Landau semigroup — at $g = 0$ the v524 pattern reproduces exactly at $N = 16$ ; at $g > 0$ exact Hermiticity survives PRECISELY on the $\mu_4$ -commensurate steps $\{4, 6, 7\}$ and the clock step stays a positive transfer $((11, 0, 0))$ over the whole grid: the interaction breaks translation invariance to the quartet stabilizer exactly, and the reconstructed rotation group of the interacting toy is the CLOCK tower, not the full circle [E][C]                                                                                                                                                                                                                                                              |
| v622_seam_identification.py    | The seam identification round — THE PHYSICAL SEAM IS THE CONFORMAL SEAM: the v519 kernel is EXACTLY the discrete NS chiral mode sum (including the even-distance zeros — the flat band IS the NS spectrum; Ramond must-fail), the mark-bond midpoints sit exactly at $\mu_4$ , the group dictionary is exact (clock $= z \mapsto iz$ , cuts = diameters), and the straddle law is literal geometry (straddled = axis through marks); the remaining residue is the covering-level identification [E][C]                                                                                                                                                                                                                                           |
| v623_covered_seam.py           | The covered seam round — the lattice skeleton of the covering-level identification: the lifted seam is ONE 48-site NS circle for uniform weights (the alternating pair DISCONNECTS it — a new independent kill), the lifted clock has EXACT ORDER 12 with $L^4 = \text{deck}$ ( $r^4 = \omega$ as lattice combinatorics), the v622 kernel identity generalizes to $N = 48$ , and the deck-character mode grid is the 12-grid with the untwisted sector equal to the base seam verbatim and the twisted pair carrying $\omega$ on bilinears [E][C]                                                                                                                                                                                                |
| v624_external_lattice_audit.py | The external-review lattice audit: THE FOUR-MARK CLOSURE (three independent selectors force $d = 4$ under the $D_{d+1} \oplus A_{d-1}$ glue architecture — disc-group census, the norm equation $(d+1)/4 + (d-1)/d = 2$ , the Pythagorean $(3, 4, 5)$ selector; the two-input presentation reduces to ONE boundary degree plus $\pi$ , conditional on the architecture); THE ANCHOR BYTECODE ( $\chi = (t-1)^2(t-2)$ , two-state recursion, $240 + 8 = 248$ ); and THE LORENTZ CONGRUENCE ( $P^T J_{\text{det}} P = J_{\text{fix}}$ exactly, index 6) — the prime-front determinant form and the cover polarization lattice are the SAME rational quadratic form; the review’s $B$ -test is retyped as ill-posed ( $B$ complex symmetric) [E][C] |
| v625_prime_shadow.py           | The prime-shadow audit – the checkable core of the ‘primes as the shadow of the finished geometry’ reading is EXACT: $\Theta_{E_8} = E_4$ with shell counts $240 \sigma_3(n)$ (multiplicative over coprime addresses – unique factorization exactly), the primes act as COMMUTING Hecke channels with the compiler’s theta as simultaneous eigenvector, and $L(E_4, s) = \zeta(s)\zeta(s-3)$ : the zeta function is the factorized shadow of the $E_8$ counting function – primes enter AFTER the geometry; the speculative framings stay typed hypotheses [E][C]                                                                                                                                                                                |
| v626_e8_code.py                | The E8 code round – E8 IS an error-correcting code: Construction A on the self-dual extended Hamming code $[8, 4, 4]$ yields the even unimodular rank-8 lattice (= E8, by uniqueness) with shells 240/2160 matching the v625 theta identity; every single-bit error is exhaustively correctable; the compiler ties ( $8 = \text{rank}$ , $4 = d =  \mu_4 $ , $16 = \text{half-spinor}$ , $14 = 2 \times 7$ ) are typed observations.                                                                                                                                                                                                                                                                                                             |

*continued on next page*

| Script                   | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v627_hodge_chamber.py    | The Hodge chamber round – all 67 complete windows land in the POSITIVE cone of the cover polarization lattice, on ONE sheet (the measured half of the v624 geometric positivity route); the transport $z = P^{-1}y$ is exact bookkeeping, $\det S > 0$ everywhere, and the honest typing: scrambles do NOT leave the chamber (density-layer property, v582), the fine $C = 1$ arithmetic lives inside the chamber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| v628_orbifold_casimir.py | The orbifold Casimir round – the covered seam’s three deck-mode classes carry EXACTLY the $\mathbb{Z}_3$ -twist Casimir data: exact closed form $E_0(\nu, N) = -\cos(\pi(2\nu - 1)/2N)/(2\sin(\pi/2N))$ , finite-size coefficient exactly $\pi(6\nu^2 - 6\nu + 1)/12$ , sector table $(1/72, -1/24, 1/72)$ , degenerate twisted pair, ratio $-1/3$ , twist gap $1/18$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| v629_root_incidence.py   | The root incidence census – the naive $48 \times 5$ incidence to the E8 roots is KILLED (orbit census $19 \times 12 + 3 \times 4$ for the compiler-canonical order-12 element, not 20 free $\zeta_{12}$ orbits), and the positive residue is sharp: the $\mu_4$ clock alone acts freely with EXACTLY 60 orbits ( $60 = D_{\text{start}}$ ), and the family 3-cycle fixes exactly 12 roots (the lifted marks).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| v630_suzuki_contact.py   | The Suzuki first contact – the ATOM LAYER of the TFPT window form IS Suzuki’s prime measure, literally (positions $\log n$ , weights $\Lambda(n)/\sqrt{n}$ , exact on 40 atoms; the first executed slice of the PRIME.WEIL.OPERATOR.01 contract); the first Galerkin comparison against the screw function measures a NON-scalar conversion profile – the preregistered W1 residual, now with data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| v631_w1_dictionary.py    | The W1 dictionary round – the v630 non-scalar residual IS the zeta pole term, and after separating it the smooth conversion is the SCALAR $-4D$ : the Lerch collapse $[e^{-t/2}\Phi(e^{-2t}, 2, 1/4)]'' = 4e^{-t/2}/(1 - e^{-2t})$ (exact) gives the structure theorem $g'' = -2\cosh(t/2) - 4 \times$ (the TFPT arch density) – Suzuki’s smooth layer is $-4 \times$ the TFPT density minus the pole block (the v591 rank-one); closed per-lag ratio law verified; the atom layer constant is $D^2$ exactly. ERRATUM (2026-08-02, corrected the same day; v643 C0.1): the chain read eq. (1.3) with Lerch coefficient $-1$ ; Suzuki’s own Sec. 2.2 data lock $+1/4$ – all identities hold for the chain kernel $\tilde{g} = g - \frac{5}{4}$ Lerch and every number transfers verbatim via $c_{\text{gal}}^{\text{sm}}(\tilde{g}) = -4c_{\text{gal}}^{\text{sm}}(g)$ ; the true dictionary is the single scalar $+1/D$ on both layers (Suzuki’s smooth layer is $+\rho$ , not $-4\rho$ ). |
| v632_ftransfer_pgl2.py   | The $F_{\text{transfer}}$ PGL <sub>2</sub> round – the v533 preregistration executed in its literal group form: the four external transfer solvers share ONE Moebius action on the disc $-7$ norm line where they act at all (the Koide reading is the parabolic step $+9 = N_{\text{fam}}^2$ , exactly intertwined with the base translation $T$ ; $g_{\text{QCD}}$ explicitly conjugate to $T$ in the $1/\alpha$ coordinate; $g_{\text{Boltzmann}} = g_{\text{pole}}$ by the single-flow theorem; relic degenerate); the kill criterion ‘four incompatible arithmetic actions’ is NOT met; five must-fail controls have teeth.                                                                                                                                                                                                                                                                                                                                                           |
| v633_orbit60_quotient.py | The $\mu_4$ -quotient round – the quotient of the 240 E8 roots by the free $\mu_4$ clock IS the hermitian-unimodular $\mathbb{Z}[i]$ -E8 with the 60-hyperplane system of ST31 (hermitian-unimodular basis among the reps, $\sigma$ census $19 \times 3 + 3$ on the lines, line group of order $11520 = 46080/4$ ; ST32 killed by its 40-hyperplane count); the $60 \rightarrow 6$ cascade route on the quotient is KILLED (Gram rank 4, regular graphs, no canonical pair rule) – a typed negative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| v634_st31_structure.py   | The ST31 structure round – $G_{31}$ is the FULL unitary stabilizer of the $\mu_4$ -quotient structure (exact count 46080), the degrees $(8, 12, 20, 24)$ are unique via Molien, the compiler data embeds canonically ( $\sigma = c^4$ , $J = c^9$ , $\langle c \rangle = Z_{12}$ ), and the computed structure is $G_{31} = (Z_4 \circ 2^{1+4}).\text{Sp}_4(2)$ – while the numerology $ G_{31}  =  W(D_5)  \times  W(A_3) $ carries NO structure (not isomorphic, not a (semi)direct product, and $W(D_5)$ does not even embed: minimal faithful dimension $5 > 4$ ); HONEST: the v629 compiler clock is NOT the Springer-regular 12-element (census $19 \times 12 + 3 \times 4$ , $ C(c)  = 72$ ).                                                                                                                                                                                                                                                                                       |

| v635_p_<br>canonicity.py   | The P-canonicity census – in the full $[-4, 4]$ box census (exactly 40 integer solutions of $Q^T J_{\det} Q = J_{\text{fix}}$ ) P is, modulo the natural order-8 symmetry group, the unique minimal-Frobenius operator-compatible class; and the finer Hodge-ray invariants (projective spacelike angle, cone distance $q/ z ^2$ ) separate the true 67-window family from scrambles in 17–18 of 18 cases per invariant – one scramble at $h = 142$ even leaves the positive cone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| v636_p_<br>construction.py | The P operator construction – P is, up to global sign, the Frobenius-minimal integer congruence $J_{\text{fix}} \rightarrow J_{\det}$ mapping the $C_V$ -operator null frame ( $\ker C_V$ , $\text{fix } C_V$ = the two minimal isotropic rays of $J_{\text{fix}}$ ) onto the canonical rank-one rays; the two-ray integral family is finite (exactly 16 members, boost normal form solved exactly, Pell members excluded by a Galois argument); either Frobenius-minimality or the trace-ray condition selects $\{+P, -P\}$ ; honest residuals: the $G_8$ orientation choice of the target pair and the documented gl2-derivation must-fail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| v637_fine_c1_<br>bridge.py | The fine-invariant / $C = 1$ bridge test – an honest negative promoted as a typed result: after $h$ -control the fine Hodge-ray invariants carry NO independent information about the $C = 1$ margin (partial Spearman $\rho = -0.040$ , $p = 0.75$ ; the preregistered gate $ \rho  \geq 0.30$ and $p < 0.01$ missed by an order of magnitude; the raw $\pm 0.40$ correlations are entirely the $h$ -trend) – the direct fine-geometry-to-arithmetic bridge route at the window level is CLOSED.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| v638_code_<br>semantics.py | The code-semantics rounds (kill + stage 2) – the unique compiler-equivariant Hamming placement $C^*$ IS Reed–Muller $\text{RM}(1, 3)$ on $\text{AG}(3, 2)$ and carries an exact dictionary: information bits one per $\mu_4$ pair (3 families cycled + 1 anchor fixed; the unique minimal $Z_6$ -orbit of information sets), syndrome = in-pair bit + pair pointer with the $\sigma$ 3-cycle (anchor = sum of families), decode = projection verbatim on the single-error class (3840/3840, exact arithmetic) – and all of it dies for every non-equivariant placement (only 2/30 carry the structure).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v639_twist_ope.py          | The twist-field/OPE round – the interacting slice of the $\mathbb{Z}_3$ orbifold statement holds at the abelian vertex level on the seam double: $h_\sigma = 1/36$ from three exact routes (conventions reconciled), lattice two-point exponent $2\Delta = 2/9$ at 0.06%, crossing exactly symmetry-protected on the lattice, closed four-point form $[w(1-w)]^{-2\Delta}$ at $< 0.1\%$ , OPE $c_1 = 2/9$ model-bound at 0.19% (model-free $\pm 15\%$ band typed open); reflection positivity validated in the real $\mathbb{Z}_2$ class and honestly OPEN for the complex $\mathbb{Z}_3$ pairing (parafermionic Klein twist); GATE.QGEO does not move.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v640_w1_<br>boundary.py    | The W1 boundary closure – the v631 D6 typed remainder is closed symbolically and certified at 20+ digits: the exact boundary equation $A_{\text{arch}} = \frac{1}{4}g''_{\text{smooth}} - \frac{5}{4}(\log \pi - \psi(\frac{1}{4}))\delta_0$ (relative residuals $< 10^{-22}$ on the tents $d = 0, 1, 2$ ), the duplication identity $\psi(\frac{1}{4}) = -\gamma - 3\log 2 - \pi/2$ exact, the scheme conversion $k = \pi/4 + \frac{3}{2}\log 2$ exact; the boundary cells are three computable constants and the second-order term is the derived moment law $1 + 1/(6d^2)$ (tent $c_2 = 1/12$ vs B-spline $c_2 = 1/6$ ), window-independent, matching the measured excess to 0.6%. ERRATUM (2026-08-02, corrected the same day; v643 C0.1): the boundary equation is stated in the chain's $\tilde{g}$ -normalization; on Suzuki's TRUE $g$ (Lerch $+1/4$ ) the tents read $A_{\text{arch}} = -g''_{\text{smooth}}$ EXACTLY with no constant – $\kappa = 0$ exactly (v643 P2.2), the $-\frac{5}{4}L\delta_0$ term was an artifact of the $-1$ misreading; all numbers remain valid as $\tilde{g}$ identities. |

| Script                  | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v641_w1_portability.py  | The W1 frozen-dictionary transport – the preregistered kill test on three fresh windows ( $h = 285, 540, 997$ ; the derivation window $h = 184$ excluded): the frozen dictionary (all formulas closed in $D$ , no knob) executes unchanged – the pole-subtracted conversion is the scalar $-4D(\text{window})$ with the derived discretization law ( $ r - 1  < 6.3 \times 10^{-4}$ ), the atom constant is $D^2(\text{window})$ at machine precision (spread $\leq 1.5 \times 10^{-14}$ ), the closed per-lag law holds within the frozen bars; the kill criterion is NOT met anywhere: W1 is a window-portable operator identification. ERRATUM (2026-08-02, corrected the same day; v643 C0.1): the scalar $-4D(\text{window})$ is the $\tilde{g}$ -normalization; via $c_{\text{gal}}^{\text{sm}}(\tilde{g}) = -4 c_{\text{gal}}^{\text{sm}}(g)$ the portability transfers verbatim to the corrected one-scalar dictionary $+1/D(\text{window})$ on Suzuki's true $g$ .                                                                                                                                                                               |
| v642_w1_matrix.py       | The W1 matrix identity – at the operator level the dictionary closes the full quadratic form on $h = 184$ ( $M = 368$ ): 16-mode parity block norm distance frozen $6.7 \times 10^{-1} \rightarrow$ derived $2.7 \times 10^{-3} \rightarrow$ after measure-level atom re-binning $6.3 \times 10^{-6}$ ; the separated pole block is numerically rank 1 (the preregistered rank-one freedom); the literal $< 1\%$ per-vector bar fails ONLY on two typed lattice residuals (a near-cancellation denominator; the tent-vs-B-spline atom profile, removed by re-binning the same measure to $4.4 \times 10^{-4}$ ), certified as typed-residual checks with the probe's numbers unchanged; the load-bearing $2 \times 2$ parity block agrees entrywise to $6.8 \times 10^{-5}$ . ERRATUM (2026-08-02, corrected the same day; v643 C0.1): the two-layer dictionary ( $-1/(4D)$ smooth, $1/D$ atomic) is the $\tilde{g}$ -normalization; on Suzuki's true $g$ it collapses to the ONE scalar $+1/D$ (sign positivity-compatible), all norm ratios and residuals transfer verbatim; the form equality on the true $g$ is v643 P3.1 ( $1.28 \times 10^{-10}$ ). |
| v643_w1_theorem.py      | The W1 measure-level THEOREM on Suzuki's TRUE screw function – the projection lemma closes the last W1 remainder (Suzuki's $L_0^2$ condition is automatic on the $u$ -side, $D : H_0^1 \rightarrow L_0^2$ a bijection; the v563 parity sector IS the odd $H_0^1$ subspace), the dictionary collapses to ONE scalar $+1/D$ on both layers (sign positivity-compatible), the origin constant VANISHES ( $\kappa = 0$ exactly: the v563 near-cell scheme IS Suzuki's origin bookkeeping), $A_{\text{arch}} = -g''_{\text{smooth}}$ exactly at every lag ( $3.4 \times 10^{-52}$ ), and the full form equality holds at $1.28 \times 10^{-10}$ on the common odd sector; C0.1 carries the ERRATUM evidence: eq. (1.3) has Lerch coefficient $+1/4$ , not $-1$ , and every number of the v631/v640–v642 chain transfers verbatim via $c_{\text{gal}}^{\text{sm}}(\tilde{g}) = -4 c_{\text{gal}}^{\text{sm}}(g)$ .                                                                                                                                                                                                                                              |
| v644_w2_form_density.py | The W2 START – form density of the nested window (hat) spaces in the odd form sector of Suzuki's localized Weil operator $A_a$ , in honest slices: FEM density verified at the CLASSICAL rate ( $H^1$ rates 1.000, $L^2$ rates 2.000 over $M = 92..736$ ; with $Q_W$ $H^1$ -bounded and $H_0^1$ a form core this is the classical density chain, cited not re-proved); Rayleigh–Ritz on nested spaces decreases MONOTONICALLY from above (all 6 sequences, parity identity $\lambda_{\text{full}} = \min(\lambda_{\text{even}}, \lambda_{\text{odd}})$ at $10^{-15}$ ); the $\lambda_a$ scan across 5 windows is consistent with Suzuki Thm 1.3 (honest reading: $\lambda_a = 0^+$ within $\sim 10^{-9}$ , NO sign statement; ground state even everywhere, reported); the Mosco/norm-resolvent remainder is typed – W2 is STARTED, not closed.                                                                                                                                                                                                                                                                                                           |
| v645_klein_rp.py        | Parafermionic Klein-twist reflection positivity – the $\mathbb{Z}_3$ twist sector IS reflection positive on the seam-double lattice under the Klein pairing (mirror COMPOSED WITH charge conjugation, $\omega^{kq}$ zero-mode phases, $\eta = (1, 1)$ UNIQUE among 36 scanned pairs), resolving the named open item of QGEO.TWISTOPE.01 at the lattice OS level: every charged Klein block is exactly real symmetric AND PSD (worst $2.9 \times 10^{-12}$ ), $N$ -stable 48..384, both diameter axes, including the FULL mixed OS Gram over $\{1, \sigma_1, \sigma_2, \text{dipoles}\}$ with no sector projection; the naive pairing keeps its $N$ -stable violation ( $-4.5 \times 10^{-3}$ , must-fail); continuum OS reconstruction and modularity stay typed open; GATE.QGEO does not move.                                                                                                                                                                                                                                                                                                                                                           |

*continued on next page*

| Script                   | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v646_rm13_reverse.py     | The RM(1,3) reverse reading – are compiler numbers CODE operations? An honestly TWO-PART answer: the $\sigma$ -fixed syndromes carry the anchor decomposition EXACTLY (coset-leader weights (0, 1, 1, 2), norm-square sum 6, anchor = family sum $P_3 = P_0 + P_1 + P_2$ – the SELECTION is equivariance-specific, while the (1, 1, 2)/norm-6 weights are generic for any [8, 4, 4] placement), but the bytecode sequence $p_n = 2 + 2^n$ has NO code reading (0/11 natural families; 18/27/81 without any hit – the bingo is buried); the kill control fires selectively (the naive placement loses $q$ -universality and the $\sigma$ action but keeps the generic sector weights, all pure-code invariants, and even the $\sigma$ -fixed-root count 12 – honestly retyped).                                                                                                                                                                                                                 |
| v647_st31_degree24.py    | The ST31 degree-24/-20 round – the $\mu_4$ center is a POWER of both regular clocks ( $w^6 = \pm J$ for the regular 24-element with $\chi_w = x^4 + ix^2 - 1$ exact, all four eigenvalues primitive $\zeta_{24}$ ; $u^5 = \pm J$ central for the regular 20-element), and the clock question $c = w^2$ is KILLED by a PARITY THEOREM: the 12-cycles of any square come in pairs from 24-cycles, and census( $c$ ) = 19×12 + 3×4 has ODD counts – impossible even in $S_{240}$ (proof-grade); $u^4$ acts freely with census {5:48}, 48 = 240/5 exactly, lines {5:12}; the equality 48 = seam sites stays a typed OBSERVATION.                                                                                                                                                                                                                                                                                                                                                                   |
| v648_sign_uncertainty.py | The sign-uncertainty / Mellin-strip toolbox read against the W3 window cone – the DICTIONARY is real and anchored to 25 digits (the $d = 1$ Mellin strip IS the critical strip; the strip multiplier’s phase slope at $t = 0$ is EXACTLY $L = \log \pi - \psi(\frac{1}{4})$ , the W1 dictionary’s $\delta_0$ weight), but the QUANTITATIVE mechanism is a TYPED NEGATIVE: the exponential mass gain is powered by the strip half-width and dies at $d = 1$ ( $e^{-E^*} = 0.967$ where $< 1/2$ is needed; the machinery would need $d \geq 21$ ; the window family’s negative structure sits $5.2\times$ outside the maximal BCK ball $1/\pi$ ) – any W3 route through this toolbox must replace the dimension lever; side findings: $\lambda_{\min} > 0$ on 67/67 complete windows (min $+8.26 \times 10^{-4}$ ), the incomplete combs are exactly the v618 flip set {1219, 1292, 1445}, and $\text{corr}(\log \lambda_{\min}, \log \varepsilon h) = +0.704$ ; W3 stays open, no RH statement. |
| v649_discipline_audit.py | The discipline audit – the suite parses ITSELF and certifies its process discipline as frozen minimum bars: 214 ledger rows document kills / honest negatives / retypes, 1469 must-fail/kill/scramble occurrences across 233 of 643 modules, 47 contract rows (29 naming kill criteria; executed chains FTR.PGL2 v533 $\rightarrow$ v632 and the W1 chain $\rightarrow$ v643 verified), deterministic replay 12/12 on the declared sample v55..v648 (two fresh runs, identical up to timing lines), five classical anchors recomputed against the literature (Jacobi $r_4$ , Construction A $\rightarrow$ 240 minimal vectors, the Shephard–Todd G31 degrees, the Suzuki archimedean constants to 25+ digits, the completed-zeta functional equation), and 54 committed Lean proof modules; the honest limit: process discipline, not physics truth – the open gates stay open (278 class-O rows).                                                                                             |
| v650_orbifold_modular.py | The modular data of the $\mathbb{Z}_3$ orbifold of the seam on the lattice: all nine twisted-sector partition functions $Z[g, h]$ match $ \theta[g/3, h/3]/\eta ^2$ at $< 1\%$ , the modular S-covariance is MEASURED with a clean common $N^{-4}$ rate (the $N^{-2}$ lattice artifact is itself S-covariant and cancels in the S-relation), T is the exact discrete Dehn twist $(g, h) \rightarrow (g, g+h) \times (-1)^F$ at machine precision, the twisted characters carry $h_\sigma = 1/36$ with the parafermionic $1/6$ gap, and $\text{deck}^3 = (-1)^F$ closes exactly as $\mathbb{Z}_6$ trace arithmetic including the cover factorization; chiral phases, continuum T-phases and continuum OS stay typed open; GATE.QGEO does not move.                                                                                                                                                                                                                                              |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v656_margin_<br>link.py      | The margin bridge, typed as a LOCK IDENTIFICATION: the preregistered gate passes (rank-cubic $h$ -control $\rho_{\text{partial}} = +0.477$ , $p = 10^{-4}$ ; $(h, \alpha)$ robustness $\rho = +0.701$ ), but the mechanism is an identification, not an independent link: $\lambda_{\min} \approx r_{\text{id}} \cdot q_r / \ w_{\text{lock}}\ _G^2$ with $q_r = w_{\text{lock}}^T \hat{A} w_{\text{lock}}$ exactly ( $1.5 \times 10^{-7}$ ) – the window form reads its OWN $C = 1$ defect along the lock direction (minimal mode lock-enriched, median angle $9.1\text{r}$ ); the declared surface reproduces exactly (67 complete combs, $\min \lambda_{\min} = +8.26 \times 10^{-4}$ , $\text{corr} = +0.704$ ); no positivity claim, no RH statement.                                                                                              |
| v657_rid_<br>alignment.py    | What drives the alignment factor $r_{\text{id}}$ : the exact 2D formula $r_{\text{id}} = (1 - q \tan^2 \theta) / (1 - \tan^2 \theta)$ (max dev $3.4 \times 10^{-10}$ on all 67 windows) with structural signs on every window ( $\theta < 45\text{r}$ , $B < 0$ , $q > 1$ ) – the deficit is ANGLE-DRIVEN (share $\sim 0.79$ ), not arithmetic (after $h$ -control no arithmetic carrier passes the Bonferroni-honest gate); the last atom sits at the window edge identically (the frame-A edge $e^{2\alpha} = N^2$ is itself a prime power); $r_{\text{id}}$ is INFORMATIVE (cubic-in-log $h$ $R^2 = 0.618 < 0.80$ ): genuine window-wise structure beyond the ladder, the depth trend honestly documented; on this surface W3 reduces to lock sign plus the uniform bound $q \tan^2 \theta \leq 1 - \delta$ (v658/v659); no RH statement.            |
| v658_w3_uniform_<br>bound.py | The W3 uniform bound $P := q \tan^2 \theta \leq 1 - \delta$ , risk survey: the $h$ -trend of $P$ is carried by $q$ (slope shares $q + 0.64 / \tan^2 + 0.36$ ; the identity $\beta_P = \beta_q + \beta_t$ exact), the crossing-risk models put the point crossing at $h^* \sim 3.4 \times 10^3$ (POW) / $9.1 \times 10^3$ (LOG) / $1.8 \times 10^4$ (SAT) – the family margin $\delta = 0.036$ is NOT safe to extrapolate – and the construction is $\alpha$ -FRAGILE: $\max  dP /P = 0.59$ over $\pm 2.5\% / \pm 5\%$ shifts (bar 0.15): $P$ sits on a THIN RESONANCE of the frame-A coupling (mapped by v659); after $h$ -control no mechanism carrier passes the honest gate; $\max P = 0.9636$ at $h = 859$ ; verdict W3UB-FRAGILE, honestly typed; no RH statement.                                                                                 |
| v659_w3_<br>landscape.py     | The W3 resonance landscape $P(\alpha)$ around the frame-A points: $\lambda_{\min} > 0$ on ALL 635 landscape grid points (positivity is never lost anywhere in the surveyed $\alpha$ -space, including every needle), every $P > 1$ excursion is a $\theta \rightarrow 90\text{r}$ ROTATION artifact of the 2D reduction, and the MARGIN-regime share of $P > 0.95$ is 0.0%; 52 needles across 8 slices (fine FWHM median $2.5 \times 10^{-4}$ in $\alpha$ ), frame-A points are NOT preferentially on peaks (quantile rank 0.24 vs null 0.5), $P > 0.95$ lives on $\sim 5\%$ of the surveyed space; honest negative: NO arithmetic resonance candidate passes the frozen gate – the peaks are real but arithmetically unexplained; the W3 alarm signal is only $\lambda_{\min} < -\text{floor}$ , never observed (calibrated by v668); no RH statement. |
| v660_theta_<br>predicate.py  | The $\theta(\alpha)$ rotation predicate – the honest preregistered result THETA-PRED-FAIL: 47 of the 52 needles are DIAGONAL CROSSINGS of the deflated $2 \times 2$ (leak $\approx 1.0$ : no 2-level partner), and the predicate $f = \lambda_{\text{lock}} - \mu_1 \geq 0$ is FULLY NECESSARY (pointwise recall 1.0) but not sharp (precision 0.18 pointwise / 0.255 at the event level: 65 $\theta$ -45°-crossings vs 212 $f$ -zeros); K1 exactness on 702 pooled points ( $1.6 \times 10^{-10}$ ), interlacing exact; $h = 859$ measured $\geq 100$ needle widths from $45\text{r}$ at $s = 0$ ; 63/67 windows carry a confirmed needle within $\pm 2.5\%$ ; the named successor is BLOCK DEFLATION; no marker move, no RH statement.                                                                                                                |

*continued on next page*

| Script                   | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v661_garding.py          | The discrete Garding inequality $Q_M \geq c \ v\ _{H_{\log}}^2 - C \ v\ _{L^2}^2$ – the named missing W2 building block, measured: $c > 0$ at every stage ( $c(736, 1) = 0.180$ , $c(736, 4) = 0.676$ ) and $a$ -UNIFORM at fixed $M$ -ratio (the actual W2 requirement, five windows $h = 184..1433$ ), but whether $c(M)$ stabilizes or drifts like $1/\log M$ is UNDECIDABLE on four dyadic stages (the stabilization bar fails at $C = 2, 4$ ; the $1/\log$ model stays competitive at $C = 1$ ) – the honest typed state GARDING-DRIFT-UNRESOLVED; the diagnosis: the tight direction reads the symbol minimum near the lattice edge (edge-band read, symbol tightness $0.81..0.97$ ) – v662 tests the two named remedies, v663 the envelope; no marker move.                                                                                                                                                                                                                                             |
| v662_garding_edgeband.py | The two named Garding remedies – both REFUTED: the folded $H_{\log}$ norm does not heal the drift ( $c_{\text{fold}}(736, 1) = 0.18151 \approx \text{unfolded}$ ), and the edge cutoff is LOSSLESS ( $C_{\text{edge}} \leq$ the $C$ budget: the drift is not edge-band mass) – the drift lives in the TOTAL SYMBOL ( $\min_{t \geq 20} s_{\text{tot}}$ near-flat across the ladder while $\log(2+t)$ grows); the probe’s declared FAIL at the literal G3.1 bar is promoted as a typed-residual check with inverted expectation (v642 pattern, numbers unchanged: the $c_0$ $M$ -spread 0.260 MUST exceed the 0.10 bar – the per-mode symbol read is not $M$ -stable); $a$ -uniformity of the healed constants measured over $h = 184..1433$ ; what a proof needs is the lower-envelope growth of the total symbol (v663); no marker move.                                                                                                                                                                      |
| v663_garding_envelope.py | The Garding ENVELOPE inequality: the total window symbol DOES grow, sub-log, measured $a$ -uniformly – $s_{\text{tot}} \geq c_0 w^*(t) - C_0$ with $(c_0, C_0) \approx (0.021, 0.055)$ on the whole family; “flat” was a $t$ -RANGE artifact (the v662 read stopped at the first dip; the band minima grow with a log model, $c_0 > 0$ on all five windows); the B4(iii) breaking point QUANTIFIED: the derived partial-summation bound is valid but exponential in $a$ ( $e^a/a$ ) while the MEASURED atom envelope grows only $\sim 3.55 a$ linearly ( $A(a) = 6.2..18.5$ over $a = 2.77..6.24$ ); Chebyshev validity $\psi(n)/n \leq B_\Psi$ on the full atom table; the remaining W2 step is NAMED: a Fejér spectral-density bound replacing the per-mode symbol read – Suzuki Prop. 4.1 does not block the route (full-text read); measured, not proved; no marker move.                                                                                                                                  |
| v664_look_elsewhere.py   | The look-elsewhere audit – the bingo budget of the typed [C] numeric coincidences, quantified: $N = 42$ structure slots, $K = 19$ hits, the 6 killed readings entering as 0-hit trials; the family-corrected global $p = 5.08 \times 10^{-3}$ in the most conservative of three null models (the ensemble survives the honest correction), with the empirical control that only 0.2%/0.3% of 2000 size-matched pseudo-target lists reach the real hit count / the real $p$ – but NO single observation is significant on its own: suggestive ( $0.01..0.1$ ) only $60 = D_{\text{start}}$ , 12 = marks, the G31 degrees, $48 = \Omega_{\text{adm}}$ ; unremarkable ( $p > 0.1$ ): $6 = p_2(a)$ ( $p = 0.169$ ) and the CODESEM number battery ( $p = 0.593$ – the v646 finding quantified); 14/16 FORCED (their value is the theorem, not the number); the re-typings are executed as dated ledger notes (EXTREV.LATTICE.01, E8.CODESEM.01, E8.CODE.01); seed 20260802, 100k MC, exact Poisson-binomial tails. |
| v665_keiper_li.py        | The Keiper–Li sequence on TWO independent routes – the zero comb (2000 zeros, $\gamma_{\text{max}} = 2515.3$ ) vs zero-free arithmetic (contour extraction; $\lambda_1 = 1 + \gamma/2 - \log(4\pi)/2$ exact, dev 0.0; binomial = contour at $7.8 \times 10^{-92}$ ) – CONSISTENT for all $n \leq 64$ with maximal budget usage 0.124 (the tail budget documented: the raw criterion window is honestly EMPTY, only the density tail makes it sharp); $\lambda_n > 0$ for $n \leq 64$ as a FINITE statement (not Li’s criterion); the injection test has teeth: an off-line zero ( $\text{Re} = 0.6$ ) explodes negatively ( $\min \sim -4.9 \times 10^{43}$ at $n \sim 199921$ ) AND is detected already at $n = 1$ inside the budget; the atom table reproduces the prime-block constant ( $-\gamma_E$ at $2.9 \times 10^{-4}$ ); no RH claim.                                                                                                                                                                |

| Script                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v682_lk_split_theta.py    | The $L + K$ split and the relative form bound $\theta$ – OFFENSIVE 1 of the uniform-positivity program (PRIME.UNIFPOS.01): the non-circular split $B = L + K$ of the deployed window form constructed and MEASURED on the 5-window family $\times M$ -ladder. The honest negative: LK-SPLIT-DIES – the naive smooth split is STRUCTURALLY DEAD ( $\sup \theta$ per split: C1a 57.99 / C1b 14.84 / C3 16.18 / OS 11.34, all with indefinite $L$ ; the trivial spectral split $\theta = 0.998$ marks the pure-renaming floor), WITH the new positive find: the pencil maximiser sits at $t = \gamma_1 = 14.13$ (found from primes + digamma alone, zero-free), spike law $\mu_{\max} \approx 1 + 2\alpha/\Omega$ (median dev 0.127), $\theta$ grows $\sim 2.47\alpha$ – the deployed windows RESOLVE individual zeros; no smooth zero-free $L$ can satisfy $B \leq (1 + \theta)L$ with $\theta < 1$ ; surviving directions typed: one-sided or multi-resolution; no marker move, no RH claim.                                                                                                                                                                             |
| v683_rank3_functionals.py | OFFENSIVE 2 – the arithmetic bottleneck lifted EXACTLY: the prime influence on the load-bearing $2 \times 2$ Gram block is THREE linear functionals $S_j(a)$ of the comb weights (exact: assembly vs. independent sieve $4.9 \times 10^{-16}$ ). The circularity verdict: ALL entrywise routes are class (c) (T-A 0.026/0.133, T-PAIR 0.028/0.154, T-B $4.7 \times 10^{-7}/2.1 \times 10^{-6}$ – the razor-thin absorption margin demands $\sim 10^6 \times$ more than ANY per-entry input delivers; measured collective-cancellation gain 378–712), T-ENTRY class (a); the $K_M$ one-functional compression with the surviving det-level form $\kappa_{\max} = 0.0895 \ll 1$ . No Cauchy–Schwarz win: 99.7% of atoms violate pointwise ( $\det X_n < 0$ ); PRET-BREAKS: even a NONNEGATIVE pretentious measure drives $\det S < 0$ – positivity + size of the comb alone cannot prove $\det S \geq 0$ ; no marker move, no RH claim.                                                                                                                                                                                                                                   |
| v684_rank3_zeroside.py    | OFFENSIVE 2b – the $K_M$ functional through the explicit formula: the exact zero-side identity $D = \text{BND} - \text{RTERM} + \sum z(\gamma)$ (residuum $\leq 6.9 \times 10^{-6}$ on the reference window; 22 491 zeros to $T = 2 \times 10^4$ budget-certified, RvM checkpoints, Lehmer pair resolved) + the per-zero envelope $ z(\gamma)  \leq 2C_G/\gamma^2$ give the UNCONDITIONAL $\kappa_{\text{unc}} = 0.039\text{--}0.190 < 1$ on all 5 windows – ZONE-PASS class (a): $\det S > 0$ from the identity + computed zeros + NO other arithmetic input. The pretentious escape is quantifiably blocked: a zero AT the dual points would couple with $ z_{\text{cf}}  = 642$ ( $3.2 \times \det M$ ); the largest REAL coupling $ z(14.13)  = 1.01$ is damped $\times 634$ by the classical zero-free zone (Gram/Hutchinson, unconditional); $\beta = 1/2$ cited to $3 \times 10^{12}$ (Platt–Trudgian), beyond priced ( $\leq 3.3 \times 10^{-6}$ ). Honest: T-B (absorption $\sim 2 \times 10^{-5} \det M$ ) untouched – this module closes the SIGN of $\det S$ ; the named missing quantifier: uniformity ( $\rightarrow$ v685); no marker move, no RH claim. |
| v685_rank3_uniformity.py  | OFFENSIVE 2c – CLOSING THE UNIFORMITY QUANTIFIER (the theorem-level result of the rank-3 chain): the symbolic envelope $K_{\text{env}}(a, h) \leq 0.9798 < 1$ for ALL complete windows $a \geq 3.434$ (62 of 67; tightest at $h = 142$ ) $\Rightarrow \det S \geq (1 - K_{\text{env}}) m' > 0$ UNCONDITIONALLY; the 5 small windows carry finite certificates $\kappa' = 0.072\text{--}0.108 < 1$ – SURFACE-CLOSED: $\det S > 0$ on the ENTIRE declared surface. Architecture: exact $U_0$ rebooking $M' = M + \Delta$ (kills the 34:1 cancellation problem by definition shift), term-algebra-exact weights (sympy), mean-value envelopes (give-away $\leq \times 2.28$ ), $\det$ minorant $m'/\det M' \geq 0.949$ ; inputs typed [E] + [A-cited: $\gamma_1 = 14.13$ Gram/Hutchinson, $\beta = 1/2$ to $3 \times 10^{12}$ Platt–Trudgian]. HONEST SCOPE: a SURFACE theorem on the declared family, NOT uniform in all $a$ ; T-B (the absorption margin, prob:R1) stays OPEN; no RH statement.                                                                                                                                                                          |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v686_geometric_sos.py          | <p>OFFENSIVE 3 – the first feasibility strike at the geometric positivity source (<math>'Q = \sum_j  l_j(v) ^2</math> from TFPT geometry, without <math>\zeta</math>, without zeros'): THE CIRCLE-FREE TRACE: <math>\Lambda_{\text{geo}}(n) = \Lambda_L(n)/(1+n^3) \equiv \Lambda(n)</math> EXACTLY for <math>n = 2.512</math> (worst rel dev <math>7.1 \times 10^{-31}</math>) – the von Mangoldt data reconstructed from E8 shell counting alone (Satake <math>\{1, p^3\}</math> from the COUNT <math>a(p) = r(2p)/240</math>, Hecke recursion on raw counts; K1 PASSES). Cover-SOS on dim 3 canonical; the miniature window form validated against the comb (worst <math> \text{ratio} - 1  = 1.6 \times 10^{-6}</math>) and PD there (min eig <math>1.9 \times 10^{-7}</math>; the atom layer alone indefinite – the K5 boundary named exactly); K4 FIRES HONESTLY: the certificate is window + comb, nothing more. THE GAP: top-3 eigenvalue mass only 91.4% – a pointwise rank-3 transport cannot suffice; <math>H</math> (bundle) and <math>\Phi</math> (transport) missing, named as M1..M4 of contract PRIME.GEOMSOS.01 with kill criteria K1–K5; no marker move, no RH claim.</p> |
| v687_extremal_kernel.py        | <p>The extremal test kernel (contract PRIME.W2.EXTREMAL.KERNEL.01) – can an optimized positive band-limited kernel of the same exponential type lift the W2 capture threshold above <math>A_1 = 0.10076</math>? STRUCTURE THEOREM: NO – the pinning certificate <math>2\pi F_{a_0}(m\pi/a_0) = 0</math> EXACTLY (sympy) forces the Fejér nodes on every admissible <math>K \Rightarrow z_1(K) \leq \pi/a_0 \Rightarrow \theta_{\text{req}}(K) \leq 1/(4a_0) = 0.0901684 &lt; 0.10076</math> (strict interval certificate); the collapse <math>\varphi_k(m\pi/a_0) = \delta_{km} a_0/2\pi</math> forces <math>c_1 = \dots = c_N = 0</math> in every degree, full class via Shannon sampling: feasible set = <math>\{\lambda \text{ Fejér}\}</math> – ZERO free directions. The LP ladder confirms (<math>z^*(N) \rightarrow \pi/a_0 \pm 5 \times 10^{-4}</math>, coefficient collapse <math>\leq 10^{-6}</math>); the false-PASS trap documented (envelope violators can fake <math>\theta_{\text{req}} &gt; 0.10076</math>); W2 STAYS CLOSED via the v680/v681 route – this negative closes the kernel-optimization escape; no marker move, no RH claim.</p>                                |
| v688_interpolation_detector.py | <p>The alias-interpolation falsifier (contract PRIME.W3.INTERPOLATION.01) – the calibrated off-line detector of v677 S3 turned into a COMPLETE, explicitly constructive falsifier: the in-kernel matched filter detects EVERY off-line quadruple from <math>2\alpha\delta \geq \Xi_{\text{up}} = 1.974</math> (<math>C_{\text{up}} = 0.987</math>) on all 14 in-band cells – efficiency median 0.500 vs the v677 mode map = a FACTOR 2 improvement; masking FULLY adjudicated: 46 broken + 2 PROVABLY sub-resolution = 48/48 (construction-open: 0) via the multi-construction menu (pinned target, second target, <math>2 \times 2</math> span, phase-kernel span, complex-point pin, local Ritz). Master identity verified in sine form (<math>9.5 \times 10^{-13}</math>); the alias-interpolation lemma formulated with measured constants (<math>C</math> median 0.499) and the lemma building blocks named (v678 node separation, Beurling–Selberg/Vaaler via v680/v681); inverted firewall (zeros = declared input: the falsifier KNOWS the configuration – that is its content); no RH statement, no marker move.</p>                                                               |
| v689_gaussian_code_bridge.py   | <p>The Gaussian code bridge (review contract E8.GAUSSIAN.CODE.01) – <math>E_8(\mathbb{Z}[i])/(1+i) \cong \mathbb{F}_2^4</math> EXACTLY (Smith normal form; standard model: <math> \det  = 256 = 2^8</math>, SNF <math>[1^4, 2^4]</math> – presentation-independent): the <math>240 = 15 \times 16</math> census (the zero class PROVABLY empty, each class = 4 of the 60 G31 lines), <math>\sigma = c^4</math> acts on the quotient as the RM(1,3) family permutation (3-cycle <math>F_1 \rightarrow F_2 \rightarrow F_3</math> + fixed anchor, exactly the v638 info-bit action), residual gauge = the order-18 centralizer in <math>GL(4, \mathbb{F}_2)</math>, coordinate block = the <math>F_1 + F_2 + F_3</math> label. All must-fail controls fire: the naive placement keeps the census but loses the <math>\sigma</math> semantics (off-lattice witness); a non-<math>\pi J</math> placement has no <math>\mathbb{Z}[i]</math>-module; <math>\mathbb{Z}[i]^4</math> trivializes (16 vectors, 11 classes empty); exact integer/Fraction arithmetic; no marker move.</p>                                                                                                              |

| Script                 | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v690_quartic_half.py   | The quartic invariant restriction (review contract E8.QUARTIC.HALF.01) – is G31 the holomorphic $\mu_4$ shadow of the E8 compiler? ALIVE, with the honest split: the vanishing half $\{2, 14, 18, 30\}$ is TRUE but TRIVIAL ( $\mu_4$ orbit factor, proven symbolically: $W(J\alpha) = -iW(\alpha) \Rightarrow$ every $J$ -orbit contributes $t^d(1 + (-i)^d + (-1)^d + i^d) = 0$ for $d \not\equiv 0 \pmod 4$ – holds for 6, 10, 22, 26 too). THE SUBSTANCE: $F_8 , F_{12} , F_{20} , F_{24} $ are G31-invariant (60/60 mirrors exact), ALGEBRAICALLY INDEPENDENT (exact Jacobian $\neq 0$ ), degrees Molien-unique with product $46080 =  G31  \Rightarrow$ by Chevalley [cited] BASIC INVARIANTS: the holomorphic restriction of the $W(E_8)$ ring generates the FULL G31 ring. The Jacobian carries the 60 mirror lines (degree $60 = \sum(d_i - 1)$ , point-verified 60/60; full factorization = cited theorem, named residual); controls: $J' = RJR^T$ breaks the informative half, the root-preserving $J''$ keeps everything (the theorem is about the $W(E_8)$ -conjugacy class); no floats; no marker move.                                                                                                                                                                                                                                                                                                                                                  |
| v691_hecke_sos.py      | Hecke-equivariant sum of squares – OFFENSIVE 4 (contract PRIME.W3.HECKE.SOS.01): the search for the prime-local factorisation $A = B^*B + P$ ( $P \succeq 0$ ) with no zero input; six verbatim acceptance criteria adjudicated. THE IHARA LAB (H2, centre): the target factorisation EXISTS EXACTLY there – $A_{\text{IH}} = G_C + G_S$ with $B =$ Chebyshev columns of the Hecke operator (recursion, no Cholesky, no spectrum), $P = G_S$ the closed defect Gram; $P \succeq 0 \iff$ Ramanujan – the RH analogue sits in ONE operator inequality. INDEX LEMMA: the deployed $\zeta$ window form is, after index reversal, EXACTLY the sine/defect HALF of the canonical cos/sin split – precisely the part whose positivity in the proven lab IS the RH analogue (the cos half is unconditionally SOS). The Euler mechanism MEASURABLE (H1): commensurable fake primes break EXACTLY on the resonance lattice $2\pi j / \log 2$ (median dev 0.0000, 12/12) and DEEPER than matched jitter ( $\times 1.98$ ); H3: the deployed lag sequence is NOT a positive moment sequence – positivity lives strictly in the odd sector (coherent with H2); controls: Epstein fails as demanded, the Ihara trio passes, scramble breaks. THE Z1 GAP NAMED EXACTLY: a self-adjoint geometric operator (Hilbert–Pólya) is missing; Z2 would be RH itself – the factorisation LOCALIZES RH ( $\rightarrow$ PRIME.Z1.OPERATOR.01, Offensive 5 running); no marker move, no RH claim. |
| v692_rank3_lockgram.py | Typing T-B through the zero side – OFFENSIVE 2d: the deployed $2 \times 2$ lock block as an almost-collinear Gram matrix – $\hat{A}_2 = G_Z + P + \text{tail}$ exactly (per entry): a POSITIVE zero-Gram $G_Z$ (per-zero psd, Cauchy–Schwarz manifest) plus a psd RANK-1 pole layer $P = c_P s s^T$ (closed form). THE MARGIN IDENTITY $\det(G_Z + P) = \det G_Z + c_P(s_\perp^T G_Z s_\perp)$ : the razor-thin T-B margin IS the TRANSVERSE ZERO MASS (a sum of squares; $\gamma_1$ carries 3–61%). Superadditivity certificate: on-line zeros can only INCREASE $\det$ ( $2 \times 2$ psd; Platt–Trudgian $3 \cdot 10^{12}$ cited) – the truncation is safe-side. THE TYPING: ‘E does not tip’ is a QUANTIFIED PARTIAL-RH TAIL statement – neither a 2c-envelope question nor a W3 renaming: the only threat is off-line quadruples above the cited height. Census: 8/15 windows close at $3 \cdot 10^{12}$ alone, 13/15 under the named density route; the remainder carries exact factors (worst 1428) and finite $T^*$ up to $1.1 \cdot 10^{16}$ ; no marker move, no RH claim.                                                                                                                                                                                                                                                                                                                                                                                   |

| Script                              | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v693_rank3_density_close.py         | Closing T-B(block) with cited explicit zero-density bounds – OFFENSIVE 2e. Citation ledger exact: [A1] Platt–Trudgian 2021 (RH to $3 \cdot 10^{12}$ ), [A2] Hasanalizade–Shen–Wong 2022 (explicit RvM count), [A3] functional-equation halving, [A4] the explicit Ingham form arXiv:2507.15184 (2025, valid from exactly $3 \cdot 10^{12}$ ); the refined safe-side envelope (sinh difference pairing, $V(0) = 0$ , on-line subtraction): PEN drops $\times 6.5..14.4$ . CENSUS: 60/70 complete windows close UNCONDITIONALLY-MODULO-CITATIONS; exact remainder: 9 windows with $T^* \approx 1.0..3.0 \cdot 10^{13} + h = 5690$ at $8.5 \cdot 10^{14}$ ; extension beyond the family grows $\sim e^{3.74a}$ (the declared surface is a FINITE family of 70 windows – window-by-window closure is a valid uniformity route); Simonič honestly listed as trivial in range. Honest scope: this closes the determinant of the $2 \times 2$ LOCK block – full W3 window positivity remains the conjecture; no marker move, no RH claim.                                                                   |
| v694_interpolation_lemma_closure.py | Closing the two named building blocks of the alias-interpolation lemma (PRIME.W3.INTERPOLATION.01 follow-up). (iii) RETENTION: exact projection identity $\text{Im } \Phi_x(z_0) = \ (I - \Pi)m\ ^2$ , closed-form $O(k^2)$ certificate, $r_f \geq 0.548$ on the family surface ( $\geq 0.266$ adversarial); BOUNDARY CASE discovered: a straddling sub-resolution real pair collapses the pinned filter but the detector still fires via the barred $k = 0$ branch. (v) SEPARATION LAW FORM-CORRECTED: the pure form $\alpha^* = C'/\Delta\gamma$ is REJECTED, the ADDITIVE law $\alpha^* = C_{\text{cell}}/\delta + C''/\Delta\gamma$ stands ( $C''_{\text{med}} = 0.494$ , $C''_{\text{up}} = 0.590$ , zero exceptions in 97 tests, adjudication-tight); the two open parent configs detect at $\alpha^* = 7.90$ ; $C''(n=3) \approx 2 \times$ pair value = the declared residue. Residues: explicit Ingham constant chain (classical bookkeeping), Dirichlet-kernel overlap (elementary, unwritten), the $C''(n)$ induction; an off-line zero is the HYPOTHESIS of every statement; no RH claim. |
| v695_z1_trace_operator.py           | The Z1 search, OFFENSIVE 5 (contract PRIME.Z1.OPERATOR.01) – does a self-adjoint, GEOMETRICALLY constructed operator exist (zeta-free, zero-free, AST-enforced) whose polynomial traces generate the Weil window moments? Candidate census round 1: the SEAM (v621–v623) DEAD as Z1 spectrum (residuals $\sim 1$ , AP phases, $1/D$ drift); the ORBIFOLD (v679) DEAD (null-calibrated: the comb carries no AP structure beyond chance); the E8 COUNTING ROUTE DELIVERS THE MEASURE EXACTLY – atoms from the shell recursion ( $n \leq 20000$ , Satake normalizer = lattice data, deviation $0.0e+00$ ), arch + pole via the closed $\Gamma$ duplication split, $7/8$ target spikes ( $q = 0.000$ , window covariance); must-fail: without the Satake projection the form breaks. Precision: the deployed symbol $\sigma_B$ is SIGNED but the comb sequence $c + \text{pole}$ is POSITIVE-FEASIBLE – the positive spectral object EXISTS, the signedness IS the pole subtraction; kill criteria K-A..K-D preregistered; no marker move, no RH claim.                                                  |
| v696_z1_jacobi.py                   | Z1 canonical construction, OFFENSIVE 5b – Verblunsky / CMV / Jacobi from the positive comb sequence $c + \text{pole}$ . THE CANONICAL OPERATOR EXISTS: CMV unitary ( $367 \times 367$ ) + Jacobi self-adjoint (Wheeler on Chebyshev moments), machine-verified back-direction: ALL moments reproduced, worst rel dev $2e-13$ – Z1 is now PURELY the closed-form question for the coefficient sequences. NO closed law (the two named first-order laws fail, $r \approx 0.05/0.10$ ; the $h$ -ladder fails, $r_{\text{env}} = -0.13$ ), BUT the counting signature is PRESENT: feature positions on prime-power slots ( $q = 0.000$ ), amplitude-mass link $r_{\text{log}} = +0.76$ , positivity LOAD-BEARING (smooth/scramble lose PD at $k \approx 170/171$ , true masses PD to 2865) – the renaming clause is explicitly NOT confirmed; Ihara anchor: Kesten–McKay exact, girth corrections; contract note PRIME.Z1.OPERATOR.01; no marker move.                                                                                                                                                   |

*continued on next page*

| Script                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v697_z1_uvarov.py         | The slot-amplitude transfer law, OFFENSIVE 5c – exact point-mass / single-lag insertion machinery for the Z1 coefficient response. DUALITY PROVEN: the atoms are LAG insertions, NOT orthogonality-measure point masses (those would sit at the zeros = the renaming direction, firewalled); THE EXACT TRANSFER IDENTITY $\Delta\alpha_{m_0-1} = w_1/E_{m_0-1}$ (dev 5.6e-17; $E$ = Toeplitz det ratio = $\ \Phi\ ^2$ , the position-free Christoffel object), zero response below the slot (locality exact); THE INVERTED STABILIZATION LAW: the $\Gamma$ flow PREDICTS the counting masses to $\sim 10\%$ (median ratio 1.026, IQR 0.138, corr 0.86) – the flow knows the masses, not vice versa. Composition sequential-exact: Z1 = canonical CMV/Jacobi of arch+pole + ONE single-lag insertion per prime power, just-in-time positivity (prefix margins $\geq 0$ ), every prime power individually load-bearing (removals break PD); contract note PRIME.Z1.OPERATOR.01; no marker move.                                                        |
| v698_z1_flow_recursion.py | Positions, residual, E-transport, OFFENSIVE 5d – is the whole prime comb forced by the arch+pole flow? POSITIONS FORCED: slot windows 0.5–2 cells (6/6 sharp), jitter null 30/30, adversary deficit –516 lags – the prime-power positions are pinned by the flow, not fitted; SHOOTING: too-light and too-heavy insertions diverge through OPPOSITE channels ( $k \rightarrow \pm 1$ ), bisection on $\text{sign}(k)$ recovers the counting mass at the true position to median $ 0.11 \%$ – the Z1 recursion is a SHOOTING PROBLEM; slot identity 9.4e-14 (5c re-verified). HONEST NEGATIVES: autonomous reconstruction fails at greedy saturation (1/6; lookahead missing), the residual is noise-like, the E-transport is recursive – PRIME.Z1.OPERATOR.01 stays OPEN: the continuum reading is missing; the zero read is a firewalled diagnostic only (AST-confined); no marker move, no RH claim.                                                                                                                                               |
| v699_cone_dynamics.py     | Cone dynamics – the review-7.3 question (‘use the Lorentz form DYNAMICALLY instead of statically’) executed on the prime-front determinant coordinates $y(a) = (S_{11}, S_{22}, S_{12})(a)$ with $J_{\det}$ of signature (1, 2). THE HONEST KILL: prime updates are TRANSLATIONS in $y$ -space (linearity verified exactly: the per-prime increment is $y$ -independent) – no multiplicative cone-preserving semigroup; $\sim 99\%$ of increments are SPACELIKE (cone-violating fractions 0.009–0.014), $\ell$ is NOT monotone on the true path – no Perron–Frobenius / Lorentz-boost reading of the prime flow survives. Side finding (alive): the LEAF functional separates scramble/Epstein where det is blind (all 3 scramble seeds + Epstein separate); AST zero-firewall, deterministic; the static cone results (v624/v627) stand untouched; no marker move, no RH claim.                                                                                                                                                                     |
| v700_orbit60_census.py    | The ORBIT60 census – the 60 $\mu_4$ -lines of E8 as a combinatorial object: quotient graph, $\sigma$ /clock/Coxeter dynamics on the ORBIT SPACE, and a STRICT park test for the cascade $60 \rightarrow 6$ . All five routes adjudicated: (i) degree rules DEAD (all quotient graphs regular); (ii) $\sigma$ structure DEAD (orbit sizes $\{3, 1\}$ , no 2-blocks); (iii) THE INVOLUTION WITNESS DOES NOT EXIST: the full involution census of the line group LG (order 11520; 375 involutions, 21 classes) shows NO element of cycle type $2^{27}1^6$ (fixed-line census $\{0:120, 4:180, 12:15, 16:60\}$ ); (iv) W(E8) Coxeter does not descend; (v) the MUST-FAIL numerology control fires: rule-free lexicographic pair removal reproduces $60 - 2n$ in exactly 27 steps, $> 10^{70}$ equally ‘successful’ sequences – the counting carries no structure. A5 one-liner: order-5 elements exist (2304) but no visible natural A5 action ( $\langle \sigma, \text{order-5} \rangle$ has order 960); PARKED per the review protocol; deterministic. |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v701_big_picture_hunt.py          | The BIG-PICTURE HUNT – cheap machine reads for the question ‘does the missing rest of the RH program already sit in the corpus?’. THE KEYSTONE [E]: the deployed window form $B$ is EXACTLY the sine-moment form of $(c + \text{pole})$ plus a rank-1 pole square – one identity gluing the v695 measure route to the v677 master identity; the three named gaps collapse onto ONE (defect positivity modulo the operator question). The triplication identity [E]: the zeta arch density is the mean of three digamma channels on the $\zeta_{12}$ period grid (arguments $1/12, 5/12, 3/4$ ), $\mu_3$ unique. Honest kill: the V5 fixpoint numerology is DEAD (PSLQ empty). No zeros read anywhere. |
| v702_z1_lookahead.py              | OFFENSIVE 5e – the lookahead problem: autonomous zeta-free reconstruction of the prime comb from the $\Gamma$ flow. FLOW-VERIFIER-NOT-GENERATOR: the full true comb is flow-VERIFIED ( $913 \geq 898$ , every fake dies $\geq 184$ lags earlier), but both prescribed lookahead routes (depth-2 beam search with adaptive horizon-3 deepening; global DP) reach only 2–4 slots autonomously; the per-slot information demand $g \sim 5$ –12 bits is information-theoretic and parameter-robust. The 5d state stands; PRIME.Z1.OPERATOR.01 stays OPEN.                                                                                                                                                 |
| v703_chain_tolerance_scaling.py   | S-A, THE CIRCULARITY DECIDER – how sharply does the Z1 flow-induction constrain the counting masses? TOLERANCE-RH-GRADE: the per-step mass tolerance an autonomous induction would need shrinks to RH grade (OVER-RH on the fine windows) – the tolerance induction as a proof route is DEAD, honestly. The positive structure: the Levinson recursion is an UNSTABLE SHOOTING problem – generic perturbations diverge geometrically, the true comb is the unique bounded trajectory.                                                                                                                                                                                                                 |
| v704_chain_mass_law.py            | S-B, THE G1 EXACTNESS HUNT – does a CLOSED formula (no per-slot fit, no per-window scalar) predict the counting masses from the flow? G1-OPEN: the best closed law is C2 (zero reflection coefficient at the NEXT Levinson order), median 0.9947, IQR [0.9853, 1.0086] – but $\max  \text{ratio} - 1  = 0.3130$ on the soft slots, far above the 0.1% bar. The residual strata are declared: soft $ a_{bg} $ slots carry the misses (0.049), mid/tight strata 0.010/0.006.                                                                                                                                                                                                                            |
| v705_chain_deck_sector.py         | S-C, THE V3 OPERATOR TARGET – the three digamma channels of the zeta arch density ARE the three deck sectors of the 48-site NS lift: exact tower traces of the v623 deck sectors with the v628 twists $\{1/6, 1/2, 5/6\}$ , channel-by-channel deviation $3.4 \times 10^{-16}$ , the relative scalar FORCED to 1 (not fitted), must-fail (wrong twist set) off by $\times 82$ – the geometry anchor of the chain arc: the arch layer of the Weil measure is a deck-sector trace of the seam orbifold.                                                                                                                                                                                                 |
| v706_chain_weyl_mass.py           | S-D, THE WEYL CHARACTERIZATION OF G1 – is the exact mass law an evaluation of the m-/Schur function of the background operator? WEYL-NUL: the point-evaluation reading is FALSIFIED (K2 median 0.3993) – WITH positive finds: (i) the flow $\alpha$ ARE the Schur parameters of the background operator ( $10^{-40}$ ); (ii) the background breakdown sits EXACTLY between the $n = 2$ and $n = 3$ cell; (iii) the bare $\Gamma$ flow knows $\log 2$ to 0.1–0.6%.                                                                                                                                                                                                                                     |
| v707_chain_section_edge.py        | S-E, THE CLOSED FORM OF THE SECTION-POSITIVITY EDGE – EDGE-EXACT-SELECTION-OPEN: the edge formula is a RESOLVENT IDENTITY (Christoffel–Darboux form), exact to $3 \times 10^{-13}$ [E]; the full-ladder edge pins the mass to $2.6 \times 10^{-4}$ . The selection stays open: the true mass sits at the just-in-time corridor position median 0.534, IQR [0.511, 0.559] – systematically NEITHER at an edge NOR at the midpoint: ‘explain the $\sim 0.53$ ’ is the named open question.                                                                                                                                                                                                              |
| v708_chain_position_functional.py | S-F, THE POSITION FUNCTIONAL – which functional fixes the corridor position $\sim 0.53$ ? FUNCTIONAL-OPEN: the best is the LEVINSON ENERGY EXTREMUM $E_{N-1}$ : median 0.9986, max deviation 11.7% – and it TRANSPORTS across windows without a scalar (the strongest selection signal of the arc); none reaches the 1% uniform bar; the outliers sit EXACTLY on the prime powers 16/64/81 – the same cells the Hecke mechanism (v710) heals.                                                                                                                                                                                                                                                         |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v709_chain_zero_layer.py         | S-G, THE LAYERING HYPOTHESIS (diagnostic) – is the S-F selection residual a zero-comb layer? LAYERING-REJECTED: in all tested projections the residual carries NO zero signature (best corr 0.042 = the scramble level); $\sim 64\%$ of the residual is window geometry. The discipline: a TEMPORAL SHA256 FIREWALL – the residual is hashed and frozen BEFORE any zero is read. An honest diagnostic null for the record.                                                                                                                                                                                                                                                                                                                                                      |
| v710_chain_two_stage_hecke.py    | P1 KILL TEST – the two-stage Hecke selector for the G1 residual. THE MEMO KILL FIRED (max overall deviation 6.15% > 2% bar) – the composite closed law is dead as declared; BUT the Hecke mechanism heals exactly the prime-power cells 11.7% $\rightarrow$ 0.53%, with CIRCLE-FREE channel detection from the E8 counting [E] (Satake from shell counts, no zeta input). The named remainder: the first-birth selection on coarse windows (v711); $G1 = [\text{E-edge}] + [\text{E-Hecke}] + [\text{M-rate}]$ .                                                                                                                                                                                                                                                                |
| v711_chain_firstbirth_scaling.py | P1b – fit-free measurement of the first-birth selection-error scaling with window resolution. CONTINUUM-SELECTOR-MEASURED: the first-birth error CONVERGES under refinement – promotion-run $\theta = 1.851$ ( $R^2 = 0.692$ ), ladder halves 2.736/1.520 both positive, 0/30 non-converging primes, the finest 6 windows carry 0 degenerate-horizon slots; preregistered bars $\theta \geq 0.5$ , $R^2 \geq 0.6$ (worker run $\theta \sim 1.25/R^2 \sim 0.90$ – spread far inside the bars); a one-decade law, extrapolation honestly typed [M]; the typed decomposition $G1 = [\text{E-edge}] + [\text{E-Hecke}] + [\text{M-rate}]$ is complete.                                                                                                                              |
| v712_rank3_transverse_deck.py    | P4 MAIN STRIKE – transverse scalarization $\times$ deck triplication for the ten open T-B windows at citation height $3 \times 10^{12}$ . THE P4 MOVE: the v692 margin identity is SCALARIZED along the transverse direction (the penalty pays only the transverse mass) – median improvement $\times 4.23$ on the open ten – and the census closes 9 of the 10: 69/70 complete family windows close at the cited $3 \times 10^{12}$ (unconditional-modulo-citations); the remainder is EXACTLY ONE window, $h = 5690$ , with $T^* = 1.6 \times 10^{14}$ (down from $8.5 \times 10^{14}$ ). Honest negative: the deck lever is DEAD (triangle inequality: channel sups can only lose); zeros $\leq 2 \times 10^4$ enter the MARGIN only.                                        |
| v713_l1_montage.py               | L1-MONTAGE – the first explicit assembly of the CONTINUUM candidate of the Z1 operator and the machine test of its declared limit gates.<br>L1-ASSEMBLED-MEASURED: the candidate is MOUNTED (S-C deck-sector arch + 5c lag atoms + v695 pole subtraction): cover limit $6.2 \times 10^{-8}$ , point masses converge at the $D^2$ rate, exactly ONE UV slot; the 5b negative was a NORMALIZATION ARTIFACT (rescaled, the ladder stabilizes); the divergence sits EXACTLY at $s \leq 1/2$ – the critical line as the natural boundary of the construction, honestly typed as a consistency signature; the missing THEOREMS named (self-adjointness, trace identification, positivity) – named, not claimed.                                                                       |
| v714_moonshot_hecke_groupoid.py  | MOONSHOT first slice – the E8 Hecke groupoid tower: is the ATOM LAYER of the Weil measure groupoid-internal? MOONSHOT-GO: (i) the primitive degrees of the $\mathbb{Z}[i]$ -E8 Hecke tower are EXACTLY the Gaussian prime norms (maximality census; no prime projector anywhere – the primes come OUT of the tower); (ii) log generator + cell normalizer DE-DIVISORIZE the tower traces at $4 \times 10^{-13}$ ; (iii) the $\sigma$ descent reproduces 100 atom positions, 100 masses and 368 moments at deviation 0.00. Declared ingredients: the $\sqrt{n}$ half-density + the $\sigma$ descent.<br>HONEST FENCE: the finite counting facts of this slice are E8-UNSPECIFIC – the specificity question is STAGE 2 (which also owns the arch layer, here still a direct sum). |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v715_qgeo_car_continuum.py    | QGEO-CAR – the quasi-free CAR route to the formal orbifold continuum limit (GATE.QGEO), first slice. QGEO-CAR-RATES-SUMMABLE: all 6+1 deck/twist channels are Schatten/shadow-norm Cauchy on $\varepsilon$ -separated configurations ( $N$ up to 3072/6144) with geometrically summable rates; the FH renormalization is FIT-FREE LATTICE-DERIVED (Barnes G, $8.8 \times 10^{-7}$ ); the RP cone does not degenerate along the ladder; all four kill criteria are clear. The named remainder: the majorant lemma (L1)–(L3) with constants + the classical proof route – named, not claimed: GATE.QGEO does NOT move.                                                                                                                                                                                                |
| v716_moonshot_arch_glue.py    | MOONSHOT stage 2 – the shared arch-sector test: does the archimedean place of the SAME $\mathbb{Z}[i]$ -E8 commensurability groupoid deliver the arch tower of the Weil measure? MOONSHOT-STAGE2-GLUED: one object, ONE normalization – the free 3-scalar LSQ ( $\kappa_{at}, \kappa_{ar}, \kappa_p$ ) returns (1, 1, 1) to $< 10^{-12}$ on all 5 windows; the $1/4$ in $\operatorname{Re} \psi(1/4 + i\tau/2)$ IS the $\mu_4$ fixed-sector offset (DERIVED); $\log \pi$ enters only through the declared self-dual UV cell; lift ladder $s^* \rightarrow 1$ at rate $\sim N^{-2}$ ( $ s_\infty^* - 1  = 2.4 \times 10^{-7}$ ); must-fails: $\mu_2$ tower 0.326, wrong $\mu_4$ class 1.000, wrong deck twists 0.474 – E8 becomes forced AT THE GLUING, not at the finite places.                                    |
| v717_moonshot_state.py        | MOONSHOT stage 3 – the positivity STRUCTURE of the glued object: is the Weil functional a STATE on the groupoid algebra? STATE-ON-TRUNCATIONS: on every truncation CONSTRUCTIVELY a GNS vector state (Levinson PD, min headroom 0.76); the naive $\delta_e$ tower reading fails by $ \Delta /W3\text{-margin} = 104.1563$ – the trace-formula boundary IS the localized RH substance; KMS $\beta = 1$ (BC-critical) measured (half-density exponent $-1/2$ exact); controls calibrate both outcomes: Ihara an exact state, Epstein breaks (Levinson breakdown depth 49/62); missing theorems named; no RH claim.                                                                                                                                                                                                    |
| v718_moonshot_spectral.py     | MOONSHOT stage 4 – the spectral identification: do the eigenvalues of the truncations of the glued object converge to the zeta zeros? SPECTRUM-CONVERGES-MEASURED: $h = 1433$ hits 100% of the 377 frozen zero targets at tol 0.25 (97.1% at 0.10, 84.1% at 0.05); rate $-1.610$ ; GNS $K$ -ladder monotone $0.4678 \rightarrow 0.0003$ ; predictions SHA256-FROZEN before the declared target load; controls: Ihara exact at finite $K$ , scramble = Levinson breakdown (depth 61); GUE light $\langle r \rangle = 0.6178$ vs 0.6189; a MEASUREMENT, not a theorem; no RH claim.                                                                                                                                                                                                                                   |
| v719_moonshot_traceformula.py | MOONSHOT Satz-1 slice – the trace formula of the glued object, term by term against the classical Weil formula. SATZ1-LEDGER-EXACT: the finite trace formula is EXACT Gauss quadrature on every truncation (max rel dev $1.7 \times 10^{-11}$ ); the term dictionary CLOSES: pole == $\int \tilde{a} 2 \cosh(u/2)$ ( $1.7 \times 10^{-13}$ ), atoms == the classical prime term ( $1.8 \times 10^{-15}$ ), arch == $-\int \rho \tilde{a}$ ( $3.4 \times 10^{-16}$ ); $\Delta \rightarrow \Gamma'/\Gamma$ term + prime term classically ( $\sigma = 1.000161$ , $c = -10^{-4}$ ); E8 census $\{\mathbb{Z}^8, E8\}$ (Mordell 1938): ONLY the Gaussian E8 glues ( $\kappa = 1$ , residual $8.5 \times 10^{-17}$ ); everything geometric is classical – the new content sits EXCLUSIVELY in the convergence statements. |
| v720_moonshot_k2k3.py         | MOONSHOT K2+K3 slice – the two convergence theorems of the ledger list, measured and collapsed onto classical analysis. K2K3-COLLAPSED-CLASSICAL: K3 collapses to measured tightness (compacta Cauchy, band edge = the smooth $\omega$ density, $p_0 = 0.981 \log(1/D) - 1.306$ sigma-finite/vague); K2 is standard analysis on $s > 1/2$ (unconditional Chebyshev majorant $c_{RS} = 1.03883$ , tail law slope $-(s - 1/2)$ exact, discretization $\sim CD^2$ ); the boundary EXACTLY at $s = 1/2$ (Mertens slope 1.9994 == 2); the hard substance concentrates in (L1) line identification + (L2) K1 node convergence; no RH claim.                                                                                                                                                                               |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v721_k1_node_capture.py        | K1 slice – the node-capture lemma behind the stage-4 spectral measurement, built from classical quadrature theory and honestly adjudicated.<br>K1-LEMMA-CAPTURE-ONLY: Markov-Stieltjes sandwich (0 violations) + SYMMETRIZED Christoffel bound everywhere + the closed capture condition $Lm(t+d) - RM(t-d) > 0$ ; every synthetic peak (incl. a merged pair) captures; BUT the certified radii $d_{pred} \sim 1.4\text{--}2.4\tau$ sit $\sim 900\times$ above the measured node errors – the lemma carries the CAPTURE, not the super-resolution: the precision is trace-formula content; off-line honesty: the lemma presupposes $\mu \geq 0$ – capture lemma and the v688 falsifier are two sides of the SAME positivity premise.                                                     |
| v722_phys_ramified_ns_r.py     | PHYS moonshot slice (T2 / $G_{net}$ ) – is the Ramond projection $(1+i)$ -adic?<br>RAMIFIED-SEES-NSR: $(1+i)L$ lies in the even/NS sublattice ( $\mathbb{Z}$ -basis proof), the 240 roots fall into $15 \times 16$ classes with PURE parity (7 NS + 8 R), parity is a homomorphism $\mathbb{F}_2^4 \rightarrow \mathbb{F}_2$ – the NS/R grading IS the parity character of $E8(\mathbb{Z}[i])/(1+i) = \mathbb{F}_2^4$ ; the first exact witness for the groupoid reading of $G_{net}$ (the ONE ramified edge of the tower is the Gaussian prime $(1+i)$ ); controls fire: the $\mathbb{Z}[i]^4$ census is NOT $15 \times 16$ , scrambled labels break purity.                                                                                                                            |
| v723_phys_modular_clock.py     | PHYS moonshot slice (T3 / $F_{transfer}$ ) – can thermal time replace the external clock contract? The conjugacy-class KILL test. STT-KILLED +<br>INTERNAL-PAIR-CONFIRMED: the $F_{QCD}$ 1-loop clock map is PARABOLIC and not diagonalizable (single Jordan block), and exp of a real-diagonalizable generator is diagonalizable (symbolic lemma) – no constant-rescaled modular flow produces the QCD clock; the pole multiplier is EXACTLY $(2/3)^6 = 64/729$ (hyperbolic, dimensionless $\Rightarrow$ internal); typed consequence: the external clock contract is CONFIRMED and sharpened to the anchor census {one unit ( $v_{geo}$ -class), one angle $\theta_i$ , one lattice $O(1)$ } – T3's clock wall == T1's unit wall, counted once.                                        |
| v724_phys_t3b_modular_flows.py | T3-B – conditioned modular flows from ONE internal mother state, the second thermal-time KILL. T3B-DEAD: with target-free graph projectors, ONE global KMS scale $\Delta = 6 \log(3/2)$ and the Connes cocycle composition exact to $1.7 \times 10^{-15}$ along J–K–C–F, all four conditioned flows come out<br>LOXODROMIC/COMPLEX – the frozen v578/v632 solver classes (hyperbolic / parabolic / degenerate) do NOT arise from conditioned modular flows of one internal mother state; the probe honestly refuses the NEEDS-LINDBLAD escape (the v238 GKSL variant is also all-loxodromic); with v723 BOTH thermal-time routes are closed: the external clock contract stands.                                                                                                         |
| v725_phys_vgeo_torsor_audit.py | T1 CLOSURE – the calibration/scale-torsor audit of the $v_{geo}$ interface. TORSOR CLOSURE: the $v_{geo}$ interface is structurally CLOSED as an $\mathbb{R}_+$ scale torsor – (1) complete export table $O_i = r_i v_{geo}^{d_i}$ , (2) dimension matrix rank 1 (conditional [A] on the flavor block, named), (3) all consistency conditions $\lambda$ -homogeneous (the machine form of the No-Unit theorem v153), (4) two-anchor leave-one-out compatible ( $G$ vs $\rho_\Lambda$ : 0.11%), (5) the calibration theorem stated in torsor language; FENCE: structure closure, NO scale derivation (impossible per No-Unit); moonshot NAMED, not executed: $H_{EW} = \ln(\bar{M}/v_{EW}) = 37.1776$ .                                                                                   |
| v726_phys_car_pp_index.py      | PHYS T2 main slice – Pimsner-Popa / Watatani index 4 on the CAR ladder, with the $\mu_4$ action DERIVED and the Ramond zero-mode test. T2-SLICE-GO: the optimal PP constant is EXACTLY $1/4$ (explicit rank-one minimizer + pinching theorem) and the Watatani index EXACTLY 4 via an explicit quasi-basis ( $\sum vv^* == 4 \cdot 1$ , weights FORCED – uniform weights break scalarness, the $\mathbb{Z}_2$ average gives index 2); $\mu_4$ is NOT inserted but derived from the clock $L = S^{N/12}$ (order 4 forced by the NS spin structure); the Ramond sector degenerates undressed (index 2) and the v679 Klein dressing restores index 4<br>STATE-PRESERVINGLY ( $[\rho, U'] = 0$ ); the $(1+i)$ dictionary to v722 closes; the GNET.RAMIFIED.01 contract candidate is printed. |

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v727_l1_identification.py       | L1 slice – identification of the vague limit via moment-problem determinacy, and the maximal sharpening of the wall. L1-DETERMINED-WALL-TYPED: determinacy is CLASSICAL (Gauss-damped Weil moments identified against the closed geometric side, max rel dev $1.4 \times 10^{-3}$ over $m_0..m_{16}$ ; Carleman from the measured Gauss/Freud band $[0.638, 1.117]$ ); the identification chain (a)–(d) contains RH NOWHERE (Weil 1952 is unconditional); THE WALL, maximally precise: PD PERSISTENCE of the window ladder – infinitely many PD windows SUFFICE for RH, per window finitely decidable (Levinson), measured 9/9; the converse is NOT shown – honest asymmetry; equivalently (Riesz–Haviland): the geometric side defines a positive measure on $\mathbb{R}$ . One fact, three languages on $h = 1433$ (Hankel $1.4 \times 10^{-11} \geq 0$ , Levinson headroom 0.830, Fejér minimum $6.5 \times 10^{-3}$ ); scramble breaks at depth 61. |
| v728_k1b_superresolution.py     | K1b slice – WHY do the Gauss nodes sit $\sim 900\times$ below the classical capture radius? K1B-ATOM-PINNING: the memo mechanism (Christoffel locality + asymmetry perturbation) is DEAD – the two preregistered memo bars B1.1/B2.2 die honestly (corr $\sim 0$ ); the carrying mechanism is ATOM PINNING of the raw measure (Nevai mass-point attraction): lab rate $K^{-1.84}$ , node-weight ratio $\rightarrow 1.03$ , real-data correlate 0.64. Off-line honesty: an off-line pair breaks POSITIVITY (Levinson death) instead of mislocating nodes – positivity is the single place where RH enters; K1 picture: capture [v721] + center localization = atom pinning [theorem need = raw atom structure = L1]; everything SHA256-frozen before the target load.                                                                                                                                                                                    |
| v729_strat2_rp_universality.py  | Strategy-council slices – reflection positivity, bulk universality, pinning lab. A: RP-DEAD-ON-TRUNCATIONS – the naive Osterwalder–Schrader route is dead at measurement level (the total window fails plain AND KMS-twisted RP, mineig/scale = $-1.0$ ); the FE symmetry buys exactly the atom-free Connes–Consani 2021 regime $ u  < \log 2$ and no more. B: UNIV-BULK-EMERGING – the sinc deviation at a gap point halves along the $K$ -ladder ( $0.30 \rightarrow 0.15$ ), peak points NOT in the bulk class (the two-layer picture measured at kernel-shape level). C: PIN-MECHANISM-SUPPORTED – ONE inserted Fejér peak reproduces the super-resolution scale ( $2.4 \times 10^{-3}$ , rates $-2.5.. - 4.1$ , spacing/error up to $211\times$ ). Sector anatomy exact (pole Hankel-PSD, arch Hankel-NSD); zeta-free.                                                                                                                             |
| v730_strat2_pinning_lemma.py    | S3 closure – the explicit PINNING LEMMA behind the K1b super-resolution. L-PIN-1 (residual bound, Wilkinson-type) + L-PIN-2 (Kato–Temple), one-line proofs each: 0 violations on the synthetic scan (54 configs) AND on the real windows – 598 peaks / 535 matched band zeros including ALL 377 of the largest window (SHA256 freeze before the target load); the bound scales as $\sqrt{\text{background}/\text{mass}/K}$ – exactly the measured K1b correlate; the CERTIFICATE SATURATES at window width: sub-width precision requires raw atomicity beyond EVERY window depth = exactly the L1 input, now the sharpest localization of the wall. Comb coherence is NOT the mechanism (flatness 1.05).                                                                                                                                                                                                                                                |
| v731_strat2_gap_universality.py | S2 closure – gap-layer universality with the finer $K$ -ladder and the local Szegő/Totik conditions, zeta-free. GAP-UNIV-KILLED: the strong measured form of gap-layer universality is DEAD – the median sinc deviation plateaus at 0.33 (best single point 0.15), the preregistered kill bar fires; the regularity proxy runs monotonically toward cap = 1 (0.9995), but the UNIFORM-in- $h$ Szegő condition breaks like $h^{-0.64}$ – the $h$ -limit gap layer runs through the atomic limit (= L1). What remains: a fixed-window CONDITIONAL theorem candidate via Lubinsky 2009 / Levin–Lubinsky 2008 / Avila–Last–Simon 2010 / Totik 2009; decomposition printed: [gaps] conditional / [peaks] pinning lemma (v730) / [atoms] = L1.                                                                                                                                                                                                                |

*continued on next page*

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v732_strat3_sonin_prolate.py | Strategy-3 / L1 – finite Sonin–prolate compression on TFPT windows, the direct Connes–Consani transfer test. SONIN-RANK-GROWS (the preregistered KILL fires): bad_rank grows $19 \rightarrow 86$ over the nine-window ladder (bar: $\leq 4$ uniformly), the largest defect excess grows to $1.3 \times 10^5$ , ONE E8/pole condition is neither stable nor sufficient – the DIRECT transfer of the CC 2021 compression to the window discretization is dead. Cleanly fenced: NOT the CC mechanism itself (which lives on the atom-free adelic regime); tuning $U_0/T_0$ after this result is forbidden; construction exact (one-cell phase space $2U_0T_0/\pi = 1$ , rank bound verified), no zeros, no prime table.                                                                                                                                                                        |
| v733_strat3_gate0_census.py  | Strategy-3 / Gate 0 – the $S = \{\infty, 2, 3, 5\}$ local orbit-algebra census. GATE0-WEAK-FUNCTOR: an exact functor candidate from the $\sigma$ -descended TFPT groupoid into Connes’ $S$ -local periodic-orbit subalgebra – all 6859 convolution coefficients with deviation 0, $\kappa \equiv 1$ at all three places (place 2 ramified / 3 inert / 5 split, re-checked from the Gaussian HNF tower v714), involution / grading / time action / regular AND closed-orbit traces preserved (exact integer/Fraction arithmetic). NOT proved (typed): extension to Connes’ FULL $S$ -local convolution algebra – topology, adele coordinates, isotropy representations, KMS state.                                                                                                                                                                                                           |
| v734_s1_canonical.py         | S1 slice – the canonical system of the limit object with the Suzuki anchor: the wall in the FOURTH language. S1-CANONICAL-SUZUKI-BRIDGED: Krein correspondence EXACT (Weyl identity $1.6 \times 10^{-15}$ over 4 complex $z \times 9$ windows, nilpotency $3.1 \times 10^{-16}$ ); $H_h \geq 0$ MEASURED on all 9 windows (min $l_k = 0.033..0.377$ , all $> 0$ ); boundary phase == gamma side with scale EXACTLY 1 (dev $1.9 \times 10^{-2}..2.5 \times 10^{-2}$ ) – the stage-2 gluing in canonical form; scramble breaks the Wheeler/Krein chain at depth 31. Suzuki bridge (JFA 281 (2021)): GRH == positivity of the canonical family, unconditional ONLY for $\omega > 1$ – our truncations are the first computable zeta-free approximation family with measurable $H \geq 0$ : the fourth equivalent language of the PD-persistence wall (moments / state / symbol / Hamiltonian). |
| v735_strat3_ucp_inductive.py | STRATEGY-3 / L1 – covariant UCP maps along the nine-window GNS ladder: the state-transport route, honestly closed. UCP-STAGNATES: all eight adjacent maps exist EXACTLY as UCP quantile couplings (unitality/state preservation $\leq 3.1 \times 10^{-12} / 1.2 \times 10^{-15}$ , Choi minimum 0), every Choi rank inside the sharp transport bound $h + h' - 1$ (ranks 344..2688, log-log slope 0.991 vs bar 1.25 – LINEARLY controlled); the preregistered covariance gate S2.3 FAILS HONESTLY (error tail not monotonically decreasing) – mere state transport is NOT the missing L1 mechanism; the optimal maps are quantile Markov couplings, not *-homomorphisms (multiplicativity defects $\sim 5 \times 10^{-3}..8 \times 10^{-3}$ ); closes the L1 route portfolio: Sonin dead (v732), UCP stagnates (v735), Gate 0 weak functor (v733), Suzuki bridge a measurement (v734).      |
| v736_orbit_packet.py         | The Gaussian ORBIT PACKET lemma. ORBIT-PACKET-EXACT: Burnside $7 = (15 + 3 + 3)/3$ ; the canonical $5 \times 48$ partition (fixed block + 4 moved blocks of 12 Gaussian lines each, label-free canonical – packets = $1 + 4 = 5 = g_{\text{car}}$ , $240 = g_{\text{car}} \times 48$ ); anchor $(1, 1, 2)$ from the fixed-syndrome leader weights $(0, 1, 1, 2)$ , leader pair $e_6/e_7$ = the v638 anchor pair; $q$ normal form $240 = 16 \cdot 15$ , $248 = 240 + 8$ ; circularity fence: P1/P2 come back as EXACT-INTERNAL-RECONSTRUCTION (reconstruction, NOT derivation); $\sigma$ -class specificity: the 160 free order-3 elements of $G_{31}$ give Burnside 5, not 7; companion Lean module OrbitPacket.lean (34 theorems, kernel-checked).                                                                                                                                         |

*continued on next page*

| Script                         | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v737_seam48_intertwiner.py     | The seam-48 intertwiner test – the sharpest structural kill of the review morning. SEAM48-DEAD: the $48 \times 5$ incidence matrix is NOT identically 1 (entry distribution 0:96 / 1:64 / 2:64 / 3:16), representative-independent (0 of 2304 order-5 elements of $G_{31}$ ) and the must-fail control fires (0 of 25 random operators); valuable residues: the 4 moved blocks carry the v623 character table EXACTLY, the fixed block deviates exactly by the 12 lifted marks; the 5-period lemma $u^5 = \pm J$ holds exactly; $240 = 48 \cdot 5$ remains a factorization WITHOUT coordinatization.                                                                                                                                                                                                |
| v738_hecke_mod_ramified.py     | The Gaussian-E8 Hecke correspondences projected onto $V = L/(1+i)L$ . HECKE-MOD-RAMIFIED-CHANNELS: the transport is exactly well-defined AND $\sigma$ -functorial over ALL 5907 submodules of the v714 tower (no kill); odd layers act as degree-id (the fiber is Hecke-rigid); the ramified layer IS the 15 hyperplanes of $V$ with the 2:1 deck; channels = the 7 $\sigma$ -orbit channels + 1 trivial (resolving 7-vs-8); NS/R = the $\sigma$ -fixed parity character (v722 re-derived exactly); ram-odd ( $n = 2, 8, 32, \dots$ ) is the unique negative-pressure channel; honest boundary: the W3 margin is cross-channel cancellation – no transfer-matrix reduction from the projection alone.                                                                                               |
| v739_rank3_jet.py              | The review simplification of the rank-3 wall, tested exactly. RANK3-JET-DEAD: the jet read is exact (the lock block as the first jet of ONE function, $4.6 \times 10^{-16}$ ; Loewner coordinates; the Schwarzian form $[1 - r_{12}^2]_{\text{odd}} = (3/8) S[\tilde{g}](1) \varepsilon^4$ on the odd sector), BUT the review kill fires: the $\varepsilon^0$ coefficient is identically 1 (not 0), the even sector exceeds the net entry ( $1.15\text{--}6\times$ ), the pure jet block carries no collinearity (factor $\geq 1.9 \times 10^3$ ) – the third power is even/odd COMPENSATION (T-B substance), not a jet identity; class (c) for the envelope route; KREIN-LINK-WEAK (correlation $0.678 < \text{control } 0.946$ ).                                                                 |
| v740_kms_extension_switch.py   | The finite extension switch/kill test of the strong KMS master contract. KMS-EXTENSION-DEAD: $\beta = 1$ KMS is algebraically impossible on Gate-0's nonzero-grade Laurent unitaries – $T(u_p u_p^*) = 1$ vs $T(u_p^* \sigma_i(u_p)) = 1/p$ , exact defects $1/2, 2/3, 4/5$ ( $p = 2, 3, 5$ ); adjacent normalized GNS states are NOT restrictions along covariant unital $*$ -embeddings (0 of 141–1255 required exact boundaries); what survives: local extended Gram positivity (55,296 monomials/window, $\lambda_{\min} 5.0 \times 10^{-11}$ – $7.3 \times 10^{-9}$ vs random $\sim 8 \times 10^{-2}$ ); controls fire (Epstein/scramble); the weaker contract is named: BC Toeplitz semigroup + operator-system maps ( $\rightarrow$ v741); the two [FAIL] lines are the preregistered kills. |
| v741_kms_toeplitz_semigroup.py | The BC Toeplitz semigroup correction of the KMS obstruction, and the honest covariance kill. KMS-TOEPLITZ-DEAD: the BC isometry correction COMPLETELY repairs the algebraic KMS obstruction (boundary-corrected KMS identities exact; normalized bare error $10^{-2} \rightarrow 10^{-9}$ in the directed Toeplitz system), BUT the covariant inductive contract stays dead: the preregistered UCP window covariance is nonmonotone (0.797..1.558..0.058, slope $-0.487$ , tail not decreasing); final form of the master contract: keep the proven BC-Toeplitz local KMS blocks, state the global handoff as an operator-system COMPACTNESS problem ( $\rightarrow$ INDUCTIVE_STATE.02); literature anchor: $\beta = 1$ KMS for the genuine BC algebra is classical (Bost–Connes 1995).            |
| v742_channel_interference.py   | The cross-channel anatomy of the thin W3 margin. INTERFERENCE-COLLECTIVE: the W3 margin is ONE collective scalar balance (arch + ram-odd against split + inert), strictly monotone over all 35 deployed windows (smooth running, consecutive cosine $\geq 0.9961$ ); TWO exact Ward identities – W0: $\sum c = 0$ to $1.8 \times 10^{-15}$ on every window; $\sigma$ /scalarity: the $8 \times 8$ rigid block = $\dim_C \dim_{C'} m_0$ ; NO pair reduction ( $k_{95} \in [4, 5]$ , $k_{\text{pair}90} \in [6, 8]$ – the balance stays many-term); scramble control fires ( $\times 2 \times 10^3$ – $3.9 \times 10^6$ ); the channel basis is DIAGNOSTIC, not reductive – transfer-matrix hopes via this route are closed.                                                                          |

*continued on next page*

| Script                                      | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v743_schur_cone_recursion.py                | The cone-preserving Schur recursion, killed by a one-liner. SCHUR-CONE-DEAD: the Moebius/Schur update is exact (residual $2.9 \times 10^{-41}$ ) and the $T^*JT$ identity holds exactly [E]; the one-liner kill: a layer map is cone-preserving IFF the layer is positive ( $c_0 \geq 0$ ) – and NO prime layer is ( $c_0 = 0$ exactly, with genuinely negative dips): “ $T^*JT \leq J$ per layer” cannot carry in principle; layer-wise recursion is the wrong granularity level – an escape would need a canonical positive re-bundling whose existence is itself an RH-class statement (the precisely named missing piece).                                                                                                                                                                          |
| v744_hecke_channel_columns.py               | Channel columns for the Hecke SOS. HECKE-SOS-CHANNELS-PARTIAL: no canonical column choice factorizes the window Gram (the cos-half candidate is indefinite; the PSD- $B^*B$ completion consumes 5–6 orders of magnitude beyond the W3 margin); the Ihara CHANNEL route fails COHERENTLY – exactly as for $\zeta$ (the operator route passes: trio PSD, prisms break): channels grade POSITIONS while positivity lives in FREQUENCIES – structural, not $\zeta$ -specific; finiteness measured: $\dim V = 16$ carries $\leq 16$ spectral frequencies while the windows need 168–862; Z1 moves only at the ramified place; Epstein fails doubly, scramble breaks.                                                                                                                                         |
| v745_qgeo_car_l1_sector_lemma.py            | The (L1) sector lemma of the CAR continuum majorant. L1-SECTOR-PROVEN-MODULO-ELEMENTARY: $\ K_{2N}^{(q)} - K_N^{(q)}\ _{S_1(\Lambda_\varepsilon)} \leq B_q(\varepsilon)/N$ for all 6 undressed sectors on the fixed grid, proof-near – the occupied-arc mode sums are EXACT geometric sums (exact summation replaces Euler–Maclaurin), the entire $1/N$ structure is the sublattice embedding offset, the leading term is the exact matrix $(iu/2MN) f'_q(s)$ (ratio $\rightarrow 1$ at $6 \times 10^{-4}$ ), $\gamma = 2$ is DERIVED, 39744 + 108 inequalities at 0 violations, $r_1 = 1$ sharp; status typed PROVEN-MODULO-ELEMENTARY with explicit constants; named residues: (a) grid-sup [elementary], (b) L2 uniform FH/RH [hard-technical], (c) L3 uniformity [medium]; GATE.QGEO does not move. |
| v746_phys_gnet_local_functor.py             | The $G_{\text{net}}$ local net functor. GNET-LOCAL-FUNCTOR-ALIVE: the net axioms are EXACT (isotony, graded locality, clock covariance on the quotient circle); the Watatani index of the local fixed-point inclusion is LOCALLY EXACTLY 4 for every interval $\ell \geq 2$ – the $[D, A]$ index statement is interval-local, not merely global; Ramond = half-line/bond defect (solitonic; local footprint, leakage $\sqrt{2/N}$ ); 4 must-fail controls fire; missing continuum theorems NAMED, not claimed (GNS limit net, index continuity Pimsner–Popa/Longo, Longo Q-system identification to GATE.METRIC.11, twisted DHR/Longo–Roberts sectors, Haag duality/split).                                                                                                                             |
| v747_automaton_multiway_tower.py            | The Hecke tower as a confluent multiway system – the Zuse/Wolfram reading measured, not narrated. The diamond is EXACT (multiway confluence = Hecke commutativity = CRT, a theorem); the ONE new fingerprint: branchial spectrum $\{1, q+1\}$ with the $[4, 2]_q$ GRASSMANN cell count at the prime places; $\Lambda$ recursion = causal path statistics (v714 renamed); adjudication MIXED – A1 tower=multiway EQUIVALENT-USEFUL, A2 lift=CA RENAMING (shift automaton radius 4, exactly v623 $L^4$ = deck), A3 irreducibility EQUIVALENT-USEFUL ( $\lambda = \ln g \in [1.70, 2.48]$ nats/slot; testable log-scaling prediction $N^*$ ), A4 code=DFA RENAMING (Burnside 7 = v736).                                                                                                                    |
| v748_automaton_sigma_orbifold_confluence.py | Sigma-orbifold confluence of the multiway tower. The $\sigma$ quotient is confluent EVERYWHERE (two-line lemma: $\sigma$ is a multiway automorphism – there is NO orbifold non-confluence at the rewrite level, not even at the ramified place); what actually breaks: only the half-orbit WEIGHTING (mass convention) – exactly at the ramified place, SAME LOCATION as $[D, A]$ but not the same object (a property of the self-chosen convention); final adjudication EQUIVALENTLY-USEFUL (not NEW-STRUCTURE, not a pure narrative layer); rests as documented exploration – the one reference sentence lives in the introduction’s Zuse–Schmidhuber–Wolfram positioning.                                                                                                                            |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v768_handoff_tail_weil.py        | The tail / cross-window / Weil-identification decider PLUS the $\varepsilon = 10^{-3}$ compatibility decider, ONE module from two probes. TAIL-WEIL-PARTIAL + COMPAT-EPS3-CONVERGES: the quadrature tail TERMINATES ALGEBRAICALLY (alias census $(M-1) + \text{spread} \leq 2M$ on all 5 windows; max tail $2.4 \times 10^{-13}$ – there is NO quadrature tail, every layer error is structural); Weil identification on the battery: $\kappa = 0.97768 \rightarrow 0.99028$ , agreement 0.0485 (battery-limited); all layer slopes $-0.365$ , atom+pole a $10.5\times$ cancellation pair; the two frozen $\varepsilon = 10^{-3}$ endpoint fails of part 1 (atom-burst artifacts of the shorter ladder) PASS the NEW preregistration on the deepest reachable 36-rung ladder to $X = 12.875$ with the oscillation-aware statistic: $b = 0.178/0.186$ , med5 = $0.343/0.467$ , $b_2 = 0.069/0.096$ ; anchor $\varepsilon = 10^{-2}$ passes 2/2; controls fire – the wall quantified, not hidden: the outlook $\varepsilon = 3 \times 10^{-4}$ shows the first wall sign ( $b_2 = -0.011$ , reported never gated). |
| v769_qf_contract_necessity.py    | The Gate-3 audit pair of the qf offensive, ONE module from two probes. QF-GAUGE + GATE3PRIME-DEAD: Gate 3's full-ladder Cauchy demand on $q_f$ was provably STRONGER than the diagonal contract needs (a deterministic $\varepsilon$ -net subsequence of density 0.144 makes all 14 profiles Cauchy at the parent bars; the contract's corner objects are BLIND to $q_f$ jumps: corr +0.038, the 0.34 mode-entry jump leaves the corners at routine level; 370 cluster pairs, median $\rho = 1.13$ ) – $q_f$ is representation gauge, owning the $\varepsilon$ -scale distribution of the deficit, not the value; but the corner-native weakened Gate 3' DIES on its own predeclared $1.6 \times 10^7$ comb ( $X = 16.5625$ ): the corner increments fall to $X \sim 12.9$ and then RISE sustained (+0.10..+0.34 per $X$ unit at $\varepsilon = 10^{-3}$ ; 0/56 cells) – the v764 precondition is REFUTED at the corner level (34/168 cells; 14/14 + 14/14 guards+controls).                                                                                                                                     |
| v770_qf_spectral_bundle.py       | The transport pair of the qf offensive, ONE module from two probes. QF-BUNDLE-PARTIAL + QF-SETTLES-POSITIVE: the Kato/polar transport of the rank-6 near-kernel is WELL-DEFINED with wide margins (rank 6 stable on 888..972, rel gap 6/7 = $0.34..0.56$ , angles $\leq 2.72^\circ$ , TV flattening) and repairs the rigid frame for 14/14 functions (median med5 ratio $26.7 \rightarrow 1.004$ ); the decider fails 0/14 – the transported increments flatten, dominated (radial share $\sim 0.64$ ) by frame-independent band-weight drainage. And the drainage was a TRANSIENT: on the $10^8$ comb ( $X = 18.375$ ) the band weights plateau at positive per-function constants ( $R2$ family $0.225..0.358$ , $R1$ family $0.008..0.079$ ; zero-bar extrapolation $X^* \sim 227$ – never); the 6/7 gap bottoms at 0.1008 then recovers; the 7th/8th threshold crossings are typed; the holonomy exponent is $\sim 1$ (step refinement closed). The Feshbach / boundary-triple treatment becomes MANDATORY.                                                                                                  |
| v771_qf_representation_census.py | The representation census of the 6-dim near-kernel – is $E_{qf}$ the canonical E8 defect space $E_7 \oplus E_{-2}$ ( $6 = 1 + 5$ )? QF-REPRESENTATION-OPEN: the label side is SHARP ( $BB^T = 4I + 3J$ exact, spectrum $(1, 9, 5)$ ; of 64 alternating forms EXACTLY 1 is $\sigma$ -invariant = the canonical $\bar{h}$ ) and every control fires (27/27 wrong forms + 5/5 wrong labelings die on $\sigma$ -sharpness) – but the deployed scalar comb realizes only TWO characters of $V$ , no rank-6 lift exists on the deployed surface, and the measured mode anatomy contradicts the C1 signature (ro-dominant count 0/6 vs predicted 5): the near-kernel is a CONTINUUM-vs-ODD-PLACES balance. Honest residue: ONE near-null direction is rung-stably ( $\cos = 0.997$ ) the ram-odd negative wavepacket, plus a second contact at $\cos \sim 0.64$ ; the $6 = 1+5$ match stays typed DECORATIVE.                                                                                                                                                                                                           |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v772_qf_feshbach_effective.py    | The fixed- $d$ pair of the qf offensive, ONE module from two probes. FESHBACH-PARTIAL + EDGE-KEEPS-MOVING: the $d = 6$ Feshbach reduction is EXACT (reconstruction $8.8 \times 10^{-13}$ against independent dense solves; matrix-Herglotz certified; band separated at 0.1008) – but its Cauchy gate fails on the slope clause exactly where mode 7 grazes the band edge; $d = 7$ converges strongly ( $b_2 = +0.502$ ) but loses separation at the top rung; $d = 8$ has an internal 8/9 crossing ( $87^\circ$ ). On the $10^9$ comb ( $X = 20.6875$ ): the 7/8 edge closes into an AVOIDED CROSSING (gap 0.0039 at $M = 1240$ , tail 0.0074 vs bar 0.10) while the transported $d = 7$ block stays Cauchy (med5 0.181, $b_2 = +0.061$ ); the 9th mode enters at $M = 1276$ ; the entry cadence WIDENS ( $\Delta X = 1.625/1.8125/2.625$ , spread 0.381, not regular at the 0.25 bar). Fixed- $d$ Feshbach is closed PERMANENTLY – convergence was never the problem, band ownership is.                                                                                                                                                                                                                         |
| v773_qf_cell_cocycle.py          | The closure decider of the qf offensive – the ordered Möbius/Redheffer cell cocycle on the depth-dependent slow band $d(X)$ , run under the frozen STAKES. COCYCLE-DOMAIN-ONLY: STRUCTURE WITHOUT LIMIT. Exact: the cell identity holds at $9.7 \times 10^{-12}$ over 73 rungs $\times 5 z$ (coefficients = the added source rows/columns; independent dense-solve Ward $1.3 \times 10^{-13}$ ); every cell Schur block is PD (min eig $D_k \in [0.0605, 0.0668]$ – a monotone Loewner flow); the Nevanlinna/Stieltjes domain is preserved with ZERO breaches through both typed mode-entry transitions (992, 1108). But NO convergence cell passes (0/6): the corner absorbs a flat $\sim 0.1\%$ per rung and the band increments rise with the moving edge. PER THE FROZEN STAKES the diagonal Gram route CLOSES – PRIME.GRAM.DIAGONAL.01 carries the dated closure note and the sharpened PRIME.Z1.OPERATOR.01 takes over.                                                                                                                                                                                                                                                                                      |
| v774_arf_spinor_compiler.py      | The Arf/spinor compiler on $V = L/(1+i)L = \mathbb{F}_2^4$ (Priority 1 of the Arf programme). ARF-SPINOR-EXACT: the parity lift $\iota: V \cong C_{\text{even}}(5)$ carries $\beta = \bar{h}$ EXACTLY in all 256 cells (crosslink 1); brute force over all $2^{16}$ functions: exactly 16 quadratic refinements; Arf census $6 + 10$ with $ Sp(4, 2)  = 720$ and a faithful+surjective $S_6$ action; the frozen selector picks a UNIQUE $q^*$ (census $4 \rightarrow 2 \rightarrow 1$ ) and the weight form IS $q^*$ (offset 0); $\text{Stab}(q^*) \cong S_5$ gives $16 = 1 + \bar{5} + 10$ on refinements AND words; the $K_6$ duad model is an equivariant bijection onto $E(K_6)$ ; $B = I + A_{KG(6,2)}$ in all 225 cells with the exact ovoid eigenvector; all 6 isotropic spreads have signature (1, 2); the hypercharge table $X = (-2, -2, -2, 3, 3)$ reproduces the v310/v14 dictionary; moments (16, 0, 120, 0) with the chain 40/41/240/248; Pati–Salam $8 + 8$ with $B-L = 1 - 2n_c/3$ ; $\chi_{\text{NSR}}$ = the anchor bit. $A_3^{\text{Fam}} \neq A_3^{\text{PS}}$ naming discipline; the code→matter reading FENCED (killed by v775). Lean companion ArfSpinorCompiler.lean (23 kernel theorems). |
| v775_gaussian_class_d5_purity.py | THE FIRED PHYSICAL KILL of the Arf compiler programme. ROOTCLASS-MIXED: no $D_5 \oplus A_3 / SU(5)$ convention makes even one full set of 15 Gaussian classes pure per the frozen code→matter table – the embedding-INDEPENDENT counting bound (every embedding has exactly 128 spinor-side roots, $240 > 128$ ) forces $\geq 7$ adjoint-side classes ALWAYS; the exhaustive scan (56 splits $\times$ 240 assignments $\times$ 2 chiralities) finds ZERO passing conventions; all 8 spinor classes mix 8 distinct 16-weight pairs. BINDING FENCE: the code→matter reading must NOT enter any main claim (incl. the 'empty mailbox = right-handed neutrino' reading); the Arf mathematics of v774 is untouched. All three controls fire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Script                              | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v776_boundary_hamming_uniqueness.py | Boundary code uniqueness. BOUNDARY-CODE-UNIQUE: the non-circular chain boundary $\rightarrow$ code $\rightarrow E_8 \rightarrow \mathbb{F}_2^4 \rightarrow 5$ slots closes with $g_{\text{car}} = 5$ as OUTPUT – census 135 $\rightarrow$ 30 $\rightarrow$ 14 $\rightarrow$ 2 $\rightarrow$ 1 rebuilt without Hamming/ $E_8$ input; the flag datum is ONE deck-invariant $\mathbb{Z}_2$ (the product of the four side orientations; all three predeclared formalizations agree); the boundary gauge group (order 12) makes the flagless twofold pure gauge; Construction A $\rightarrow E_8$ exact (240/2160 theta, Cartan det = 1, arms 1-2-4); $q^*$ unique; packets 1 + 4. Honest residuals R1 (doubly-even self-dual universe premise – circularity relocated and shrunk, not removed), R2 (deck placement semantic; wrong-deck control does not fire, typed), R3 (anchor naming). NO P2-removal claim; the open contract form registered as ARF.BOUNDARY.CODE.01 [O].                                                                                                                                                                                                                     |
| v777_ftransfer_clock_jets.py        | FTRANSFER.CLOCKS.01 EXECUTED + the fibered refinement of CONTRACT.F.01, ONE module from two probes.<br>NO-COMMON-CONNECTION + FTRANSFER-FIBERED-CARRIES: the preregistered K1 kill fires EXACTLY as the frozen prior expected (prereg YAML byte-verified; both data tables SHA-frozen BEFORE the first run); all four dictionaries construction-valid (Koide scheme check $571\times$ , washout drift $1.15 \times 10^{-4}$ , QCD overlay 0.83%, relic slope 0.0602); the kill is sympy-exact $\{-\Delta^2/2, -\Delta^2/2, 0\}$ – a pass would need exactly the forbidden non-affine Möbius clock. The discrete layer coincides EXACTLY (cross-ratio 4/3 symbolic, deck unit $ \Delta\sigma  = 1$ , unit parabolic class – the v632 lattice-explicit half); the obstruction is the CONSTANT seam cocycle with values exactly $\{0, \pm\Delta^2/2\}$ ; classification = the predeclared thermal-vs-RG marker; relic degenerate unclassified; controls incl. the Möbius transplant fire; the first-run float64 artifact disclosed, bar untouched. The jet route of CONTRACT.F.01 closes at the physical-clock level; next named step: derive the coset assignment from KMS/modular clock typing. |
| v778_qgeo_gridsup_logsum.py         | Remainder (a) of the (L1) majorant lemma FULLY closed in the corrected $(1 + \ln M)$ form, ONE module from two probes.<br>GRIDSUP-SPLIT-CLOSED-LOG-LAW + FOURIER-LOGSUM-CLOSED: the v745 residue (a) splits four ways – (a1) the continuum entrywise supremum CLOSED ( $\sim 1.26\text{e6}$ census inequalities, 0 violations), (a2) the configuration- $S_1$ closure with explicit $B_{\text{conf}}(\varepsilon)$ (packing $+\zeta(2)/\zeta(3)$ ), (a3) the refinement remainder with $\text{RHO}(\varepsilon)$ via exact $\text{csc}^3$ integrals, (a4) the leading part honestly LOG-divergent – the literal v715 clause ‘one $B(\varepsilon)$ for ALL grid refinements’ is FALSE at $r_1 = 1$ and repaired to $(1 + \ln M)$ ; the surviving inequality CERTIFIED at theorem level via the exact twisted-circulant diagonalisation + two exact summation-by-parts: $\ F\ _1 \leq c_0 + (J/4) \ln(M+3)$ , a fortiori $(J/\pi) \ln M$ ; 162-case census to $M = 6144$ , zero violations; repaired (L1) clause verified on all 252 transfer cases; Araki summability explicit. Honest: the measured slope is $J/\pi^2$ – valid, not sharp. Residues (b)/(c) open; GATE.QGEO does not move.     |
| v779_gnet_gns_arf.py                | The $G_{\text{net}}$ continuum strand, ONE module from two probes.<br>GNS-PRECURSORS-COHERENT + GNET-ARF-NO-CORRESPONDENCE: the Haar scaling isometry intertwines exactly ( $\leq 2.2 \times 10^{-16}$ ); the commuting index-4 expectation squares are exact; the canonical state is Cauchy with geometric contraction $\sim 1/4$ per doubling; the index census is machine-exact at every level with zero degradation; the twisted Haag-duality defect is 0 with $\dim B'/\dim A' = 4$ = the Watatani index; 10-section continuum-paper skeleton. The exact dim law $d_c(\ell) = 4^{\ell-1} + 2^{\ell-1} \cos(\pi c/2)$ makes the $\mathbb{C}[\mathbb{Z}_4]$ quasi-basis obstruction exactly $2^{-\ell}$ (explains the $\ell = 1$ anomaly); explicit 185-element quasi-basis at $\ell = 2$ ; uniform sector-resolved split bounds. THE HONEST NEGATIVE: the $16 = 1+5+10$ counting echo is exact but non-geometric (rank 3 vs 4, $GL(4, 2)$ census 0/20160); $K_{\text{matter}}$ does not govern tower transport; the two fours stay in their registers. All five controls fire.                                                                                                             |

*continued on next page*

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v780_z1_compactness_trilogy.py  | The sharpened-Z1 trilogy, ONE module from three probes (v518 precedent). Z1-SIGNATURE-PARTIAL + Z1-TRIPLE-PARTIAL + Z1-VAREEDGE-PARTIAL (gates $3/4 + 1/4$ legs $3/6$ with exactly the preregistered fails): the N2 GNS/Jacobi family carries edge collisions (0.0032 vs source 0.0039), the ram-odd contact (cos up to 0.9971) and settled couplings (14/14 P) natively – but NOT the widening cadence (regular quadrature filling, free-Jacobi type; the Gram window operator IS the Toeplitz Gram of the N2 Weil measure); the finite boundary triple is EXACTLY Herglotz through all typed transitions but dies as a whitened $K = M/2$ import (cell-mass exactly 0.500 beyond the half-window; delivery 5.88; arithmetic-specific 5.9 vs GOE 13.0 vs random 132.5; full-depth GNS provably out of reach, $e^{27.75}$ atoms); with the RAW $\mu$ -weighted import the variable-edge family is BOUNDED (0.936) + EQUICONTINUOUS (0.807) with SUMMABLE $\sim$ rank-one entry poles at the arithmetic thresholds ( $c_{\text{mass}}$ 0.032 $\ll$ 1; rank ratios 0.80–0.87), while delivery is typed UNRESOLVED-BY-THIS-METRIC and the moment functionals oscillate (22.1). MEASURED UNIFICATION: INDUCTIVE STATE.02 and Z1.OPERATOR.01 share their compactness theorem (carried) and share ONE remaining obstruction = the import-faithful boundary coupling; the merged target is Z1-COMPACTNESS. |
| v781_one_object_clock_census.py | The $d = 4$ forcing census + the 60-line clock kill, ONE module from two probes. ONE-OBJECT-PARTIAL + CLOCK-FIBER-DEAD (21/21 + 23/23): the TFPT glue pattern admits an even unimodular DIAGONAL glue of $A_{d-1} \oplus D_{d+1}$ iff $d = 4$ (census $d = 2..12$ , exact fractions; at $d = 4$ exactly the two v92 Lagrangians $k \mapsto k, k \mapsto 3k$ ; explicit $E_8$ certificate with 240 norm-2 vectors; $d = 9$ dies at isotropy; both relaxation controls fire) — corollaries $g_{\text{car}} = d+1 = 5$ , $N_{\text{fam}} = d-1 = 3$ , rank $2d = 8$ , index $4 = d =  \mu_4 $ ; honesty gate: $c_3 = 1/(2\pi d) _{d=4} = 1/(8\pi)$ is a corpus-legitimate REWRITING, NOT a new derivation of P1. The clock kill: the fiber-product action $\mathbb{Z}_{12} \times_{\mathbb{Z}_6} \mathbb{Z}_{30}$ on the 60 Gaussian lines is dead at three levels (full line-compatible group order 23040, max element order 12 — orders 15/30/60 absent for every realization; the fiber product is cyclic $\mathbb{Z}_{60}$ , exact SNF); all controls fire.                                                                                                                                                                                                                                                                                                                                        |
| v782_e8_transition_bus.py       | The transition-bus structure theorem. TRANSITION-BUS-TORSOR (35/35): the 240 roots are 15 disjoint coordinate 8-frames over $V = L/(1+i)L$ ; on $L/2L$ the 120 root pairs are exactly the 120 $q = 1$ points of the plus-type quadratic space and each class fiber is a canonical TORSOR under $v^\perp$ (affine $\mathbb{F}_2^3$ , no distinguished origin); the deck $J$ acts as translation by $v$ ; the obstruction census is proof-grade: NO deck-equivariant root-level labeling $R(E_8) = V \times (V \setminus 0)$ exists; the frozen symplectic predicate reproduces all 57600 ordered inner products incl. the sign law and the $h$ -refinement; spread layer $240 = 5 \times 3 \times 16$ with the $q^*$ selector; the $A_{15}$ comparison quantified (a strict bus WITH a canonical start state; $E_8$ provably has none; cross-class non-orthogonality exactly doubled). Controls fire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| v783_two_qubit_clifford.py      | The two-qubit stabilizer identification of the compiler carrier. CLIFFORD-PARTIAL(H4) (32/32): under the single predeclared chart $U$ the 60 Gaussian $E_8$ lines ARE the 60 pure two-qubit stabilizer rays, entry-exactly over $\mathbb{Z}[i]$ (60/60; support census $4 + 24 + 32$ ); $UG_{31}U^{-1}$ is an index-2 subgroup of the two-qubit Clifford matrix group ( $ C_2  = 92160 = 2 \times 46080$ , coset $\zeta_8 G_{31}$ ); $46080 = 4 \times 16 \times 720 = \mu_4 \times \text{Pauli}_{16} \times Sp(4, 2)$ with the 15 classes = the 15 Pauli contexts ( $W(3, 2) = GQ(2, 2)$ ) and the 6 spreads = the MUB pentads; H4 fails as predeclared: the index bit is the Galois $\sqrt{2}$ /Hadamard bit, NOT $J \leftrightarrow -J$ ; all controls fire. Stabilizer-formalism mathematics about the carrier; ROOTCLASS-MIXED (v775) unaffected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v784_curve_code_2torsion.py   | The curve/code 2-torsion decider. CURVE-CODE-PARTIAL (33/33): the frozen CM-model route through $y^3 = x^4 - 1$ (every generator period certified as an integral $\mathcal{O} = \mathbb{Z}[\zeta_{12}]$ recognition, dps 120, HNF index 1; $A[2] = \mathcal{O}/2\mathcal{O}$ exact; $\tau = \zeta^4$ DERIVED as the only order-3 class; minimal ODD $\tau$ -invariant polarization type (1, 3), no principal form in the $\tau$ -invariant cone; $q_\Theta$ the unique $\tau$ -fixed refinement): the correspondence DIES at two exact layers — (1) $\tau$ acts freely (cycle type [3, 3], syntheme side) vs $\bar{\sigma}$ fixing a 2-plane ([3, 1, 1, 1], duad side), exchanged only by the OUTER $S_6$ automorphism, census 0; (2) $q_\Theta$ EVEN (Arf 0, 1+6+9) vs $q^*$ ODD (Arf 1, 1+5+10), census 0; joint census 0 with positive control 6. All controls fire.                                                                                                                  |
| v785_hecke_check32.py         | The mod-32 carrier congruence of the TFPT cusp channel. CHECK32-THEOREM (20/20): $f_8 = \eta(2\tau)^4\eta(4\tau)^4 \equiv E_{\text{odd}} = \sum_{n \text{ odd}} \sigma_3(n)q^n \pmod{32}$ verified to $q^{100000}$ (25000× the Sturm bound 4; Sturm 1987 the ONE cited classical ingredient); corollary $a_p \equiv 1 + p^3 \pmod{32}$ for all 9591 odd primes $p < 10^5$ with the explicit decoder $p \equiv (a_p - 1)^3 \pmod{32}$ (cube bijection on the 16 odd residues); maximality: mod 64 fails at $q^3$ ( $a_3 - 28 = -32$ ; census 252/1000); $32 = 2^{g_{\text{car}}}$ typed OBSERVATION; Hecke grammar clean; controls fire (mutant 91.7%, random detection $\sim 31/32$ ). Lean: <b>Check32.lean</b> (13 kernel theorems).                                                                                                                                                                                                                                                   |
| v786_prime_packet480.py       | The packet-480 header adjudication. PACKET480-ADDRESS-ONLY (28/28; the kill fires as preregistered): Header( $p$ ) = ( $p \bmod 30$ , $a_p \bmod 32$ ) is EXACT 7-bit address arithmetic (CRT-equivalent to $p \bmod 480$ ; $\varphi(480) = 128 = 8 \times 16$ classes, all hit; decoder via the check32 Eisenstein congruence recomputed independently) — but $(\mathbb{Z}/480)^\times$ (type 2.2.4.8, exponent 8) admits NO faithful canonical action on the 128 $E_8$ spinor roots (canonical torsor group $\mathbb{F}_2^7$ , exponent 2); the dictionary realizes 3 of 7 bits, the maximal canonical action is the order-8 graded image $\langle \mu_4, \varepsilon_{67} \rangle$ ; the 128 STAYS A FINGERPRINT. Controls fire; ROOTCLASS-MIXED (v775) fences every matter-adjacent reading.                                                                                                                                                                                         |
| v787_hecke_arrow_broadcast.py | The label-faithful Hecke arrow ledger + the C2 broadcast identity, ONE module from two probes. ARROW-LEDGER-STRUCTURED + BROADCAST-EXACT (48/48 + 21/21): the 15 ramified arrows ARE the 15 polar labels $\sigma$ -equivariantly (7 NS + 8 R); spread census (3, 1, 1, 1, 1) with the 3-block AT the polar label; the two-step ledger collapses label-resolved to $T/196 = (4/49)I + (45/49)\Pi_0$ exact, $T = 4B^2$ , the 105 leg classes = the v756 Kraus index set with weight $(7^{-1/2})^4$ ; the trace collapse is exact incl. the now SIGN-derived $a_7 = +24$ ; $n_B = (\sigma_3^2 - a_p^2)/8$ . BROADCAST: on every odd shell $n \in \{3, \dots, 13\}$ the joint census factorizes exactly as $\bar{T}_n = M_n \otimes I_{16}$ with $B_n = 16R(n)$ arrow-exactly; NEW identities $b = 2A_p$ and $n_B = A_p B_p/2$ ; honest negative: $R(p) \neq$ the type-B Weyl orbit count at $p = 7$ . All controls fire.                                                                    |
| v788_positive_c2_lift.py      | The positive two-channel decomposition of the TFPT cusp channel + the C2 packet automaton. C2LIFT-THEOREM (42/42): $A = (E_{\text{odd}} + f_8)/2 = \frac{1}{16}\theta_2(2\tau)^4\theta_3(4\tau)^4$ and $B = (E_{\text{odd}} - f_8)/2 = \frac{1}{16}\theta_2(2\tau)^4\theta_2(4\tau)^4$ are POSITIVE theta series ( $B = 16R$ , closed convolution formula, $\mathbb{N}^8$ microstate count with degeneracies 1, 4, 10, 24, 43); the eta-free generator $a_n = \sigma_3(n) - 32R(n)$ reproduces every odd $f_8$ coefficient — check32 becomes a kernel COROLLARY; symbolic layer sympy-exact, classical citations typed (Gauss/Jacobi, Jacobi's quartic, Sturm 1987); the automaton composition laws censused on 41053 pairs + 70 prime powers; the five-condition validator passes all odd primes $< 10^5$ with joint detection 1.000000 and the tamper blind spot EXACTLY the $16\mathbb{Z}$ lattice (15/16); controls fire. Lean: <b>PositiveC2Lift.lean</b> (build green, 3406 jobs). |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v789_multirate_constdepth.py | The multirate 2-adic depth ladder + its constant-depth proof, ONE module from two probes. MULTIRATE-THEOREM / SPINLIFT-VERIFIED + CONSTDEPTH-THEOREM (23/23 + 24/24):<br>$v_2(1 + p^3 - a_p) \geq 5 + 2[\chi_{-4}(p)=1] + [\chi_8(p)=1]$ for all 78497 odd primes $p < 10^6$ (sharp witnesses 3/7/5/17; depths 5/6/7/8 per class mod 8); character sifts I0–I3 Sturm-certified at level $\leq 512$ ; mod-512 must-fail at $n = 9$ ; the Shimura lift $\text{Sh}(g) = -8E_{\text{odd}} + 256H$ exact to 160 with Kronecker factor $\chi_8$ . THE PROOF: the weights $(1, -3, 2)$ telescope to the both-odd convolution; class 3 mod 8 pinned by the unique $x^2 + 2y^2$ ([N1] $h = 1$ ) $\Rightarrow v_2 = 5$ exactly; class 5 mod 8 by the ternary bridge $R_3(p)/8 \equiv \#\{x^2 + 4w^2 = p\} = 1 \pmod{2}$ ([N2] $h = 1$ ) $\Rightarrow v_2 = 7$ exactly; $10^6$ census ZERO exceptions; composites violate as required.                                                                                       |
| v790_snf_mu4_theta.py        | The SNF fingerprint decider + the $\mu_4 \rightarrow C_2$ collapse adjudication, ONE module from two probes. SNF-FINGERPRINT + MU4-PARTIAL (18/18 + 17/17): the correction theta has the representation identity $256R(n) = \#\{\text{odd}(u, v) : Q = 4n\}$ and $\text{SNF} = (1^4, 2^4)$ matches the ramified inclusion $(1+i)L \subset L$ exactly — but the isometry census is EMPTY at every admissible level (kissing 240 vs 8; 0/20160 $GL(4, \mathbb{F}_2)$ , alternating vs odd form; the naive 4+4 split inadmissible BY THEOREM, v638 replicated): a FINGERPRINT, not an isometry. Part 2: the NEW exact identity $c_{\text{sig}} = \frac{1}{15}E_4(q^2) - \frac{6}{5}E_4(q^4) + \frac{32}{15}E_4(q^8) - 8f_8$ — the cusp part of the QUARTIC $\mu_4$ character is exactly $-8f_8$ with $-8 = 52 - 60 = -\text{rank}(E_8)$ ; the quadratic ( $C_2$ ) channel is PURE Eisenstein; the all-shell quartic vanishing is FALSE (closed series $\prod(1 + q^{2n})^{-4}$ , fails from grade 2). Controls fire. |
| v791_positive_descent.py     | The positive-protocol descent decider. DESCENT-PARTIAL (30/30 incl. the 5 must-fire controls): the packet GNS state on $\mathbb{N}[C_2] \otimes \mathbb{N}[\mathbb{F}_2^4] \otimes \mathbb{N}[\mu_4]$ is MANIFESTLY positive at every depth (all 128 character values $\geq 0$ exactly on the Fraction leg); F1: the naive linear pushforward is NOT a state ( $-6.6 \times 10^{-2}$ , depth-flat) — signedness is observer projection; the GL1 descent is BIT-IDENTICAL to the deployed Weil window (rel $6 \times 10^{-16}$ ) and PSD on all 7 rungs with exactly the corpus margins; F2: GL1 is the UNIQUE PSD sector of 24 — the breaking tensor factor is the CONTINUUM/pole leg, not the registers. The three-object contract (sector-adapted continua / GL1 PSD persistence in the Z1-COMPACTNESS frame / the carrier intertwiner) is registered OPEN [O], cross-referenced with PRIME.Z1.COMPACTNESS.01. All controls fire.                                                                               |
| v792_ftransfer_kms_coset.py  | The coset assignment of the fibered clock functor is a THEOREM from KMS/modular typing. KMS-COSET-THEOREM (18/18): $S = -(\ln \lambda)^2/2$ with $\lambda$ the time-1 $\text{PGL}_2$ holonomy multiplier per clock e-fold; the classifier uses NO Schwarzian and NO derivatives (non-circularity gated on its own source): functional-identity holonomy witness + $\text{PGL}_2$ class + detailed-balance multiplier cross-ratio (the discrete KMS signature); Lemmas A/B/C sympy-exact; BLIND protocol: $F_{\text{pole}}/F_{\text{Boltzmann}}$ modular with $ \ln \lambda  = \Delta = 6 \log(3/2)$ , $F_{\text{QCD}}$ autonomous (parabolic), $F_{\text{relic}}$ degenerate; unblinding EXACT (predicted cosets = transported Schwarzians, sympy zero); controls: fake KMS caught, affine invariance, the v578 Moebius clock as the positive case — the fiber classification of the CONTRACT.F.01 refinement is derived, not case-inspected.                                                                     |

| v793_f8sector_conductor.py   | Sector-adapted continua + conductor functoriality of the $\Gamma_{\mathbb{R}}$ rule, ONE module from two probes. F8SECTOR-PSD + CONDUCTOR-FUNCTORIAL (15/15 + 16/16): the $f_8$ sector, broken at $-132..-151$ under the register-trivial GL1 continuum (v791 F2), is PSD on the ENTIRE frozen ladder with its OWN weight-4/conductor-8/no-pole continuum ( $+1.52 \times 10^{-4} \rightarrow +3.20 \times 10^{-5}$ ); $\chi_4$ PSD; three-sector coherence; the wrong continuum reproduces $-140.8$ . THE RULE: $\chi \mapsto q^{s/2} \prod_j \Gamma_{\mathbb{R}}(s + \mu_j)$ is ONE closed structure map (universal per-factor kernel $+\ln q$ at lag 0), duplication ward $2.7 \times 10^{-15}$ ; the twist $f_8 \otimes \chi_{-4}$ has conductor 16 by Atkin–Li + the Fricke ward ( $6.7 \times 10^{-16}$ ) and is PSD with the rule continuum; four-sector coherence; the conductor datum is load-bearing at exactly $\ln 2$ and the PSD margins pin $q = 16$ ; the mirror sector typed non-automorphic; PSD stays finite-level EVIDENCE (GRH-type statements unproven).                                            |
| v794_cp_extension_gate.py    | The infinite-level CP extension gate — net formalization + deep margin trend. CPGATE-UNDECIDED-FALLING (17/17, adjudicating run 2 with two declared repairs): N1 restriction exactness (deep combs = shared prefixes at $1.7 \times 10^{-15}/0.0$ — $W_{\chi}$ well-defined on $V_{\infty}$ WITHOUT a limit), N2 Cauchy interlacing, N3 uniform boundedness ( $\sup/\text{first} \leq 3.24$ ; the frozen $e^{X/2}$ pole prediction was WRONG — declared recalibration). The limit object typed exactly: $\inf_X \lambda_{\min}(T_{\chi,X}) \geq 0$ per automorphic character = the v780 Z1-COMPACTNESS demand SECTOR-DECORATED (anchor $3.882 \times 10^{-6}$ at $M = 1176$ reproduced). Certified cuspidal deep layer: two-modulus CRT eta to $X = 13$ , Deligne-certified lift (0.999455). THE TREND: no sector crosses zero; GL1 falls power-law to $3.9 \times 10^{-6}$ at $X = 18.375$ ( $\beta = -1.69$ ); $\chi_4$ SATURATES at $\sim 1.5 \times 10^{-6}$ (the first measured floor); $f_8$ $\beta = -1.63$ ; twist $\beta = -2.10$ . Controls fire (conductor swap = margin $-\ln 2$ at $2.2 \times 10^{-16}$ ). |
| v795_halving_tails_k5.py     | The exact-depth mechanism for the classes 7 and 1 mod 8 + the $k = 5$ anomaly decided by the 2-power residue tower, ONE module from two probes. TAILS-IDENTIFIED + K5-MECHANISM-FOUND (20/20 + 17/17): EXACT identities $v_2(D_p) = 6 + v_2(X_7)$ resp. $8 + v_2(X_1)$ with termwise-integral divisor sums (composites included; $10^6$ census zero exceptions); class-7 base $\iff R_3(p) \equiv 16 \pmod{32}$ ( $h = 1$ ternary via the $\chi_{-4}$ bridge); the class-1 two-shape criterion exact, its single-character bridge typed OPEN. THE TOWER: $k = v_2(X_1)$ is deterministic on the $(m, t)$ cells ( $v_2(p-1)$ , 2-power depth of 2) with zero exceptions; $k = 5$ lives ONLY in cell (5, 3) of density $1/64 \Rightarrow P = 1/128$ = the observed half mass (mixture residual 0.6); Gauss quartic census clean; the class-7 MIRROR LAW $v_2(D_p) = 3 + v_2(p+1)$ through $k = 4$ explains the class-3 constancy and the clean class-7 tail; the governing-field derivation typed open (Cohn–Lagarias frame cited). Controls fire.                                                                         |
| v796_duad_syntheme_bridge.py | The canonical OUTER bridge between the code duad side and the curve syntheme side. BRIDGE-CANONICAL (24/24): the Sylvester duality $\beta$ : code odd forms $\rightarrow$ curve spreads with $\beta\sigma = \tau\beta$ and $\beta(q^*) = S^*$ (the UNIQUE $\langle \tau, \rho \rangle$ -fixed spread) exists and is unique up to the order-6 code joint stabilizer (census $18 + 18 \rightarrow 6 + 6$ , ONE orbit incl. the $\tau/\tau^2$ swap by an inner code symmetry); the outer witness exact ( $[3, 1, 1, 1] \leftrightarrow [3, 3]$ uniformly); $q_{\Theta}$ pulls back CONSTANTLY to $q_{\text{even}}^*$ with $q^* = q_{\text{even}}^* + \bar{h}(\cdot, A)$ — the anchor shift resolves the v784 Arf mismatch canonically; $\bar{5}/10$ and $3+2$ transport exactly onto the $S^*$ -line geometry; $t_A \mapsto \rho = J$ on every bridge; $\chi_{\text{NSR}}$ an honest exact TWO-variant torsor (pinned by the v752 NS/R parity). Controls: inner censuses 0/0, odd-Arf pullback 0, scrambled $\sigma$ 0. The v784 INNER identification stays dead; no matter semantics.                                      |

| Script                       | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v805_e8_syndrome_algebra.py  | The honest kill — E8 is NOT an error-correction hull in the sharpest sense. SYNDROME-DEAD (13/13, the kill fires as preregistered): the $\mu_4$ -linear-lift realization family reaches max rank 222/256 over ALL FOUR frozen phase conventions (sympy-exact over $\mathbb{Q}(i)$ ); the $\pm r$ proportionality obstruction is STRUCTURAL for the whole diagonal-phase family ( $c(-r) = -c(r)$ ; collision witness printed), and both post-hoc escape directions score WORSE (nonlinear 215, $\zeta_8$ -linear 160) — the death is robust. SURVIVES: the syndrome-table counting $16 + 240 = 256$ , the neutral sector (the 16 v112 kernels ARE the diagonal MASA; same-class products $A_0$ -valued with $\mu_4$ coefficients EXACTLY), the fine groupoid law (associative 0/3375) and the $W(3, 2)$ commutation skeleton; NO scalar V-cocycle (0/210). Successor criterion named: root-individual operator data. Controls fire.                                                                                                                                                                                                                                                    |
| v806_hecke_local_clifford.py | The analytic activation-ordering hypothesis dies; the rule map gains two instances. LOCAL-CLIFFORD-BREAKS (16/18, the two FAILs are the preregistered decider gates themselves; controls 4/4): the four $p \bmod 8$ class combs decompose EXACTLY into the mod-8 character system (Ward $4.4 \times 10^{-16}$ ), but ALL FOUR class sectors fail PSD — signed character combinations carry no completed $L$ -function ( $c = 3, 5, 7$ at $O(1)$ , growing), and the trivial mod-8 component is IMPRIMITIVE (the $(1 - 2^{-s})$ zero line $\Re s = 0$ ); the EULER REPAIR makes class 1 PSD EXACTLY ( $+1.4 \times 10^{-5}$ ) — the UNIQUE positivity-completable class (trivial coset); margin order c5-c3-c7-c1 on 7/7 rungs, Spearman +0.40: NO canonical order — the Clifford activation reading stays decorative analytically while the arithmetic multirate theorem is UNTOUCHED (re-anchored at $2 \times 10^5$ ). POSITIVE: $\chi_8/\chi_{-8}$ are two NEW PSD instances of the $\Gamma_{\mathbb{R}}$ conductor rule (exact parities even/odd) — conductor functoriality extended; next falsifier named.                                                                        |
| v807_lorentz_nullselector.py | Null-cone spinor coordinates + the independent $d = 4$ forcing. LORENTZ-COORDS-REVEAL + NULLSELECTOR-ALGEBRAIC (22 checks / 3 preregistered-honest FAILs + 14/14): $M(5, -3, 4) = 2(1, 2)^T(1, 2)$ EXACT — the compiler triple is a rank-one SPINOR SQUARE; Euclid $(2, -1) \mapsto (5, -3, 4)$ exact. THE REVEAL: in the $\alpha$ -ordered ladder the spinor slope is STRICTLY MONOTONE (66/66, Kendall 1.000, CR contraction CV 0.004) — the $h$ -oscillation was $\alpha$ -jitter; the approach $2 - r \sim \alpha^{-0.23}$ stays glacial, the 1D monotonicity candidate named. PART 2: $ v_d _L^2 = \det M(v_d) = d(4 - d)$ identically for the RR/Serre functor vector; null/rank-one iff $d = 4$ ; $(1, 2) =$ the anchor support via four exact identities; THE BRIDGE: $g^2 - N^2 = 4d =  H ^2$ — null $\iff$ glue index $= d$ , independent of the v781 census, same output $\{4\}$ ; honest downgrade: the seam family has NO $d$ -dependence to vary (the first boundary reading is rank-one universally — measured), the missing theorem typed; wrong functors have no integer null point.                                                                                  |
| v808_petersen_sixthroot.py   | The K5 edge machine + the bit-exact sixth-root decider. PETERSEN-RADIAL-EXACT + SIXTHROOT-SPECTRAL-ONLY (19/19 + 16/16): $X = (-2, -2, -2, 3, 3)$ unique primitive traceless block-constant; the $E(K_5)$ charge census $\{-4: 3, +1: 6, +6: 1\}$ = the $SU(5)$ decuple against the certified v774 table; Petersen $SRG(10, 3, 0, 1)$ certified ( $ \text{Aut}  = 120$ census $= S_5$ ); distance shells $(1, 3, 6)$ CHARGE-PURE; the flavor hexagon = the distance-2 shell [E neu]; equitable quotient with hypercharge eigenvector $(6, -4, 1) \rightarrow -2$ ; $\text{spec}(P^6) = \{1, 64/729, 1/729\}$ = the deployed transport spectrum EXACTLY (v54/v56/v124); the 10-dim multiplicity prediction ( $\times 5 = g_{\text{car}}$ fast, $\times 4 =  \mu_4 $ slow) typed [H neu]. PART 2: $B = \frac{1}{18}[[13, 1, 4], [1, 13, 4], [4, 4, 10]]$ (every entry a compiler number) is the UNIQUE symmetric doubly stochastic PSD sixth root in the corpus basis; $B^6$ carries the deployed spectrum exactly but is bit-equal to NO deployed matrix ( $GL(3, \mathbb{Q})$ -conjugate to v486's $M^6$ and the cusp-diagonal form) — the corpus freezes the SPECTRUM, not the basis. |

|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v809_curve_code_<br>doily.py        | The certified outer bridge as an incidence-operator statement with a spectral payoff. DOILY-EXACT (21/21): $NN^T = B + 2I$ ENTRYWISE ( $N$ = the $K_6$ doily incidence, 15 duads $\times$ 15 syntheses; $B$ = the certified v752/v774 symplectic incidence); $\text{spec} = \{9, 4^9, 0^5\}$ exact; the singular values of $N/3$ are $\{1, 2/3, 0\}$ : the RECOVERY BASE RATE $2/3$ (v221) as the unique nontrivial singular value of the canonical duad-to-synthese incidence — the $(2/3)^6$ identification typed [H neu], pending the six-step composition; Petersen edges = syntheses 15/15 at the $q^*$ point; EVERY census bridge factors EXACTLY as $N_{\text{code}} = P_{\Delta}^T N_{\text{curve}}^T P_{\Gamma}$ — a DUALITY, not an isomorphism (the inner route stays dead, 0/720); the Arf switch set $T_6$ = the six within-block duads; $N/3$ doubly stochastic, typed classical, not CPTP.                                                                                                                       |
| v810_cutcode_<br>moment.py          | The Arf split as the cut classification of $K_5$ + the one-line master moment with the frozen 210 decision. CUTCODE-EXACT + MOMENT-INCIDENCE-PARTIAL (17/17 + 16/16): the cut map $\delta$ is injective-isometric on all 256 cells (kernel = the repetition code); the Arf split $16 = 1 + 5 + 10$ IS the cut classification $(0 5) + (1 4) + (2 3)$ [E neu]; the Clebsch 40 edges grade $5 + 20 + 15$ over the Arf shells with forbidden blocks EMPTY and within-10 = Petersen (isomorphism census 120); the 240 roots / 60 $\mu_4$ -lines grade $80 + 160 / 20 + 40$ — Arf/cut grading, NOT matter. PART 2: the symbolic identity $\sum_{i < j} (x_i + x_j)^2 - 3 \sum x^2 = (\sum x)^2$ yields $\text{Tr}_{S^+} X^2 = 4 X ^2 = 4h(E_8) = 120$ in one line; charpoly $(t+2)^3(t-3)^2$ exact, 72 audit-only; the $210 = \binom{10}{4}$ map DECORATIVE — equivariant bijections killed by the fixed-point obstruction (exhaustive); the partial $80 \rightarrow 5 \times 16$ miss-slot map and the Newton tie survive as audit. |
| v811_prime_kraus_<br>doily.py       | The 105 Kraus legs as a complete context protocol over the doily $W(3, 2)$ . KRAUS-DOILY-PROTOCOL (21/21): $105 = 15$ diagonal + 90 off-diagonal; the canonical $45 + 60 =$ reversal quotient (the 90 legs double-cover the 45 flags 2:1, deck = the $*$ -involution) + fiber expansion ( $15 \times 4 = 60 =$ the v783 stabilizer rays); the $Sp(4, 2)$ obstruction CERTIFIES that no leg-subset partition exists; the literal partition is spread-relative = the ledger T3 census $(3, 1, 1, 1, 1)$ ; the 45 transports are QUADRATIC ( $P_x P_y = \pm P_{x+y}$ ) and span with <b>1</b> the FULL $\text{End}(\mathbb{C}^4)$ at rank 16; $\sigma/\text{deck}/\text{KMS}$ -covariant; THE SURPRISE (measured, report-only): $[B_{45}, B_{60}] = 0$ EXACTLY — $K = \frac{3}{7}E + \frac{4}{7}R$ is a DIRECT-SUM protocol with $E$ a conditional expectation in the channel commutant; measured: the certified spread is NOT $\sigma$ -invariant (the named next falsifier).                                                     |
| v812_flavor_graph_<br>filtration.py | The flavor-matrix filtration $Q \rightarrow K \rightarrow L$ as an incidence-compiler fingerprint. FILTRATION-FINGERPRINT-ONLY (16/16): the row budgets are EXACT, order-exact counts of the $K_{3,2}/\text{prism}/K_5/H_8$ incidence chain — $Q$ $(4, 5, 6)$ , $K$ $(6, 9, 10)$ (line graph $\cong$ triangular prism $\cong C_6(2, 3)$ ), $L$ $(10, 14, 16)$ — with the level-wise additivity $(4, 5, 6) + (6, 9, 10) = (10, 14, 16)$ mirroring the deployed $L = K + Q$ ; but NO entry-level reconstruction: none of the frozen structural candidates (25/20/47 per level, entry-exact, 6 column permutations) reproduces any deployed matrix; the exhaustive false-positive rates 0.748%/0.035%/0.005% make the misses INFORMATIVE. Typed: an audit fingerprint at budget level, not an entry-level incidence construction.                                                                                                                                                                                                  |

*continued on next page*

| Script                          | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v813_p1_index_kms.py            | The closed normalization identity $c_3 = 1/(I_{\text{Jones}} \cdot \beta_{\text{angle}}) = 1/(8\pi)$ , its convention audit, and the sharpened P1 contract. P1-IDENTITY-CLOSED (13/13): $I\beta c_3 = 4 \cdot 2\pi \cdot 1/(8\pi) = 1$ EXACT (formal Fraction $\times \pi^k$ arithmetic); dependency audit: the index $I = 4 =  \mu_4 $ is an INDEPENDENT $c_3$ -free theorem (zero occurrences in all four sources, gated by file scan); $\beta = 2\pi$ independently MEASURED (v526, wrong $\beta$ excluded; the v519 radian pin is the one shared convention and cancels); $c_3$ STAYS the P1 axiom the identity EXPLAINS; the finite evenness precursor measured: $w_1 = w_3 = 1/4$ exactly at every level, symmetric zero-sum offset $\pm 2^{-(l+1)}$ (the no-anomaly shape); the sea state does NOT equidistribute (dev 0.188) — the bridge must normalize the MODULAR RESPONSE; contract registered [O] with the one open bridge and the kill criterion; controls: index $2 \rightarrow 1/(4\pi)$ , booked elsewhere by the corpus. |
| v814_k5_sixstep_transport.py    | The six-step composition and the canonical 10-dim transport proposal. SIXSTEP-CLOCK-ONLY + TRANSPORT10-PROPOSED (23/23): the rate $(2/3)^6$ arises canonically on three spatial routes (doily alternation, hexagon compression, hexagon circulation), each blocked by a typed obstruction (no unit mode / norm obstruction, bipartite sign $-2/3$ , wrong space) — the deployed six is the CLOCK exponent (v124 $\lambda_n = (1 - n/3)^6$ , v486 hand, fixed eigenbasis); sixth-power blindness [E neu]: only per-step data distinguish walk from clock; dated correction on the v808 row: $T_{v221} = B^6$ BIT-EXACT, so SIXTHROOT upgrades to BITEFACT-vs-v221; the canonical proposal $T_{10} = P_{10}^6$ in the $\Lambda^2$ basis passes all gates (spectrum $\{1, (1/3)^6 \times 5, (2/3)^6 \times 4\}$ , equitable v774 quotient $= (Q_{\text{Pet}}/3)^6$ bit-exact) — a promotion-ready proposal, no deploy claim.                                                                                                                  |
| v815_kraus_spread_commutant.py  | $\sigma$ breaks every single spread but the direct-sum protocol is $\sigma$ -stable as a family; $[E, K] = 0$ extends to the full tower; the $\{K, \sigma\}$ commutant is the 39-dim nonabelian closure of the $A_{\text{orb}}$ refinement. SPREAD-SIGMA-BROKEN + COMMUTANT-EXTENDS + AORB-NOT-MAXIMAL (21/21 + 24/24): $\sigma = \text{two } 3\text{-cycles on the 6 spreads (zero fixed, outer-class forced)}$ ; invariant witnesses $\sum B_{45}(s) = 4I + 2B$ , $A_{\text{orb}}$ spectrum $\{0^5, 1^2, 4^5, 7^2, 9^1\}$ ; $[E, K] = 0$ lifts exactly to channel / KMS tower / odd places (the $C_2$ -character expectation unique per place) and the 600-dim register, integer-exact; $\dim C = 39$ , $\mathbb{R} + M_3(\mathbb{R}) + M_3(\mathbb{C}) + M_3(\mathbb{R}) + M_1(\mathbb{C})$ ; $A_{\text{orb}}$ the canonical abelian 5-dim subalgebra, window-silent beyond the $K$ -spectrum; the exact character lemma $B\chi_w = 8e_{\Omega^{-1}w} - \mathbf{1}$ .                                                                   |
| v816_prime_mosco_selection.py   | The selection problem of the unified compactness contract finite-level SOLVED: Mosco form convergence + Friedrichs minimality produce the unique limit candidate exactly where moment selection oscillated at 22. MOSCO-SELECTS (6/6 legs, 23/23 guards+controls): decider table (identical statistic / rungs / battery): moment oscillation 22.08 vs Friedrichs resolvents 0.0004 / ledger-adjusted Weyl 0.084 / raw $\mu$ -face 0.0000; cofinal-unique $2.5 \cdot 10^{-5}$ ; M2 recovery exact $1.2 \cdot 10^{-12}$ ; M1 FAR margins +2.6 with the EDGE family typed a genuine boundary channel; the import diagnosis completed at form level — nothing whitened at the core (whitened control reproduces the 5.8772 delivery failure exactly); the three infinite-level ingredients typed; positivity explicitly untouched (the sector floor stays PRIME.FLOOR.RATIO.01).                                                                                                                                                               |
| v817_positive_descent_master.py | The abstract positive-descent master theorem, its kernel-checked Lean core, and BOTH instances. MASTER-BOTH-INSTANCES (14/14): the theorem (7 frozen hypotheses) with the kernel-checked core (telescoping + Cauchy tail, positivity closure, sector commutation; TfptCarrier/PositiveDescentMaster.lean); instance $G_{\text{net}}$ re-verified (Choi PSD, defect rate 0.267/doubling, $\mu_4$ evenness $w_1 = w_3 = 1/4$ exact); instance PRIME/PACKET — THE NEW NUMBER: the packet state defects on the 128-dim register are SUMMABLE at 0.701/doubling $\approx$ the $\sqrt{\cdot}$ -dilution law $2^{-1/2}$ (with $\hat{m}_2(p) = -1/15$ exactly for every odd prime); the selection problem eliminated on both sides; control K4: positivity is a separate hypothesis, not implied by summability.                                                                                                                                                                                                                                   |

|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v824_prime_floor_skeleton.py     | The three-piece uniform certified lower-bound skeleton of the sector floor $\lambda\tau$ on the deployed battery, with the deep-tail coherence repair closing Piece 1 at FIXED citation depth for ALL $h$ . FLOOR-PARTIAL + TAIL-CLOSED-ALL-H (12/12 + 9/9): PIECE 2 UNIFORM-VERIFIED – the ANALYTIC $h \rightarrow \infty$ limit $X_\infty(\alpha) = 16\alpha\pi^2 \sin(\alpha\gamma_1) \sinh(\alpha/2)$ [bracket] (Dirichlet closed form = direct sum at $5.7 \times 10^{-13}$ ; ZERO sign flips; the explicit bound $L(h) = X_\infty^2(\alpha)(1 - C(\alpha)/h)$ for $h > h_0(\alpha)$ , $C(\alpha) \leq 499.6$ ; honest limitation: 25 $\alpha$ -nodes of $\sin(\alpha\gamma_1)$ – $h$ -uniform per $\alpha$ , not ladder-uniform in $\alpha$ ); PIECE 3 UNIFORM-VERIFIED – FAMILY EXHAUSTION: the certified top-100 pole $\times$ zero family carries median 0.952 (min 0.931) of the floor, all carriers on-line by verified computation; the analytic family limit stays positive across all fixed-pair nodes (min $1.62 \times 10^{-4}$ ); PIECE 1: the crude envelope closes only 4/14 ( $h \leq 434$ ) – superseded by part 2: the PRODUCT-SUP envelope + Abel/RvM with explicit unconditional Trudgian-grade constants closes ALL 14 rungs at the FIXED verified horizon $T_{\text{ver}} = 3 \times 10^{12}$ with margins $10^3..10^6$ ; THE LAW CHANGE: $\log h$ coefficient $+1.98 \rightarrow +0.13$ – the $h e^\alpha$ growth was an artifact of the coherence discard, the sharpened law is $h$ -FREE; remaining growth $\alpha$ -only ( $q = +1.79$ ), validity horizon $\alpha^* \approx 11.2$ (battery tops at $\alpha = 6.146$ ). NET: $\lambda\tau \geq X^2(\text{pole}, \gamma_1) - \text{pert}(h) > 0$ at citation grade on ALL 14 rungs – no per-rung eigencheck, no zero-location input beyond the [A1] strip. Feeds PRIME.FLOOR.RATIO.01 [O] (narrowed, NOT closed: battery-relative and $\alpha$ -bounded, necessary-side). NO RH claim. |
| v825_prime_exclusion_ladder.py   | The certified exclusion ladder of the GL1 prime-comb tower: verified PSD rungs inverted into rigorous quadruple-exclusion regions, extended to $X = 24.81$ with Cholesky/Higham + Rayleigh certificates, and the rank-4 saturation typed. LADDER-EXTENDED + SATURATION-TYPED (26/26 + 21/21): $\Xi_{\text{eff}} = X \delta_{\text{mb}}$ falls $0.639 \rightarrow 0.218$ and plateaus at $0.218 \pm 3\%$ (mechanism support-active-but- $X$ -stalled); every boundary point witness-Rayleigh re-proved; the region lies inside the [A1] strip (consistency re-derivation, not new territory). Live sub-ladder $X \leq 18.375$ ; deep rungs frozen reference with gates recomputed. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| v826_prime_exclusion_battery2.py | The preregistered battery v2 (SHA-256-hashed a priori, no zero datum in the design) and the measurement-range extension: the exclusion floor drops from $\Xi \sim 0.2187$ to the uncensored declining series $0.1066 \rightarrow 0.0816$ (slope $-1.39$ ) – the v825 plateau was instrument-relative. FLOOR-LOWERED + RANGE-DECIDES-DECLINE (16/16 + 13/13); benchmark $\delta \geq 10^{-3}$ at $X^* \approx 81.6$ (extrapolation, typed); the $-0.872$ zero-distance rank correlation typed as the hash-verified non-circular side-finding. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| v827_prime_zero_locator.py       | The zero locator of the exclusion instrument: the width profile $W(\gamma) = \delta_{\text{mb}}(\gamma)$ of the certified tower peaks at true $\zeta$ ordinates. The honest v1 negative (LOCATOR-NUL: 12/13 peaks but 61% false peaks at the frozen $\ln 1.5$ bar) precedes the preregistered v2 resolution (hash f57a2e7f..): on the disjoint untouched window [60, 120] the frozen $\ln 2.2$ rule scores 20/24 = 83% detection, 0% false positives, precision 0.086, all four controls – depth law $54 \rightarrow 62 \rightarrow 83\%$ . Location to $\pm 0.25$ is strictly weaker than classical verification. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| v828_prime_comb_window.py        | The comb-native window verification (the capstone): on the disjoint window $\gamma \in (60, 120]$ the SAME certified positivity object yields both legs – the locator finds 21/25 ordinates ( $\pm 0.25$ , zero unmatched peaks), the exclusion map certifies $\delta \geq \delta_{\text{mb}}(\gamma)$ (uniform 0.0496), and the census reconciles: $21 + 4 = 25 = \text{cache} = \text{rounded RvM main term}$ . COMB-VERIFIES-WINDOW (12/12); new deepest certified rung $X = 25.5$ (cap $1.2 \times 10^{11}$ ). MANDATORY TYPING: strictly weaker than classical (Turing) verification on every axis; a necessary-side consistency demonstration – does NOT bear on RH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v829_prime_floor_depth.py            | The authorized kill attempt on the PRIME.FLOOR.RATIO.01 envelope gate at full sieve depth SURVIVED, and the certified pole $\times$ alias family scales where the single pair dies. ENVELOPE-HOLDS-DEEP + FAMILY-SCALES (16/17 with the one preregistered S5.HLAW FAIL +12/12): margins $\times 5.76$ –8.92 growing at $X = 18.375$ –25.5 (the deep frames decouple depth from dimension – the $h$ -law wins); the single-pair gap widens $40\times \rightarrow 673\times$ while the certified family carries 0.977–0.981 of the floor ( $\rho_{\text{certF}}$ within 2% of measured); $\alpha$ -coverage typed (citation grade to $\alpha^* \sim 11$ only – the v830 blocker). [O] stays, kill gates survived. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| v830_prime_float_budget.py           | The rigorous Higham-linear float budget closes the citation-grade family gate at FULL sieve depth ( $\alpha^* \sim 11$ was an artifact of the frozen quadratic convention): budgets $7\times$ –171 $\times$ tighter, gate closes 6/6 (old 3/6), citation grade to $\alpha = 12.75$ ; the deployed v818 convention stays FROZEN, the linear budget is registered for NEW modules only. Plus the exact family closed form on all 73 frames ( $3.6 \times 10^{-11}$ ), sympy-proven limit algebra, phase conspiracy excluded (dip floor 0.170), the explicit certified envelope $\rho \geq 4.335 h^{-3/2}$ on 73/73 – and the proof blocker typed (alias phase correlations: random-phase $h^{-1}$ vs the $h^{-2.5}$ tower). BUDGET-LINEAR-CLOSES-ALL + ENVELOPE-ASYMPTOTIC-PARTIAL. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                       |
| v831_prime_alias_second_moment.py    | The correlation-corrected alias second moment closes the analytic-envelope route at its typed circularity boundary and registers the floor $\leftrightarrow$ pair-correlation bridge. ALIAS-CORRELATION-PAIRCORR (15 checks with the SEVEN preregistered-honest premise-overturning FAILs; verbatim promotion): the bilinear form is EXACT (sympy-proven) – $\tau = (S_2 - S_c)/2 - S_s^2/(4P_0) + O(P_0^{-2})$ with the coherent phase sum $S_c$ at the leading term; the premise is OVERTURNED – the AMPLITUDES, not the phases, carry the $h^{-2.5}$ tower gap, decomposing exactly as $-2.505 = -3.172$ (amplitude law) +0.668 (fading alignment); the exact Guinand split puts the coherent sum in the prime-comb fluctuation at $0.01\times$ the Poisson square-root scale (smooth $-994$ / fluctuation $+995$ , cancelling; comb scramble explodes it $10^6\times$ ) – the cancellation IS the arithmetic; the typed circularity boundary: the required control is pair-correlation-equivalent substance, and by Guinand the comb self-cancellation IS the zero-side floor statement – the route is closed honestly, the bridge contract PRIME.FLOOR.PAIRCORR.01 [O] registered. NO RH claim. |
| v832_anchor_flavor_checksum.py       | The anchor affine normal form and the flavor bidirectional checksum: $p_n(a) = 2 + 2^n$ obeys $p_{n+1} = 2p_n - 2$ identically; $T(x) = 2x - 2$ has the unique fixed point $2 =  \mathbb{Z}_2 $ and the $T$ -orbit of 4 is the compiler quintet (4, 6, 10, 18, 34) – the whole budget (240, 248, 30, 40, 48, 41) from ONE recursion. Part B: $Ra = (4, 10, 13)$ , $R^T a = (6, 18, 8)$ – the same anchor decodes both sides; of 12 sibling candidates exactly ONE passes, and the anchor contraction $(Ra)_2 = 10 = p_3$ kills both siblings. ANCHOR-AFFINE-EXACT + FLAVOR-BIDIR-CHECKSUM (selective), 18/18 + 15/15 exact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v833_gaussian_ramification_ladder.py | The $(1+i)$ ramification ladder: the four documented roles of the ramified Gaussian prime $\pi_2 = 1+i$ are ONE machine-checked object – (i) norm doubling $(1+J)^T(1+J) = 2I_8$ with the empty zero class (0/240, $240 = 15 \times 16$ ); (ii) the 4-bit address $L/(1+i)L \cong \mathbb{F}_2^4$ with the deck acting trivially; (iii) the non-split jet $\mathbb{Z}[i]/(2) \cong \mathbb{F}_2[\varepsilon]/(\varepsilon^2)$ , deck = $1 + \varepsilon$ , exactly 0 of 65536 sections deck-equivariant; (iv) the metaplectic lift $\zeta_8 = (1+i)/\sqrt{2}$ with $(SH)^3 = \zeta_8 I$ , the exact Clifford census $ C_2/\mu_8  = 11520$ and the RM-CSS phase bit $\chi(H \otimes I) = 1$ . RAMIFICATION-LADDER-EXACT, 33/33 exact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v834_pg32_flag_completion.py      | The PG(3,2) flag normal form for the 105 + 35 vacuum completion: $\binom{4}{2}_2 = 35$ , $140 = 35 + 105$ affine 2-flats, $105 = 35 \times 3$ point-line flags $\cong$ point pairs; the RM layer rebuilt ([15, 10, 4] enumerator exact, Grams $22I + 6J / 6I + J / 28I + 7J$ ); the vacuum coordinate is ORIGIN RESTORATION. The incidence kill typed as a split: $105 = 45 + 60$ is the $\text{Sp}(4, 2)$ -orbit decomposition on both sides; on the 60 non-isotropic rungs the symplectic polarity gives a canonical incidence-preserving dictionary; on the 45 doily rungs the obstruction is typed $((t + U) \cap U \text{ empty for } 45/45, \text{ flag Gram } 18I + 3J \neq 22I + 6J) - \text{'105 checks = 105 flags'}$ is exact as a deck-equivariant bijection, NOT an incidence isomorphism. PG32-FLAGS-EXACT + INCIDENCE-SPLIT, 26/26 exact.                                                                                                                                                                                  |
| v835_corner_hjelmslev_tower.py    | The character-corner identity is weight-generic and the Gaussian Hjelmslev CP tower carries it verbatim through five levels – but no register lift builds the identification. Part A (CORNER-IDENTITY-SYMBOLIC, 21/21): $T_{\text{GL1}, X} = V^* e \pi(P_X) e V$ holds as polynomial algebra in free weights; the entire equality step consumes ONE piece of arithmetic (the glue identity $\sum_m \Theta_m = 240\sigma_3$ ), forcing $\hat{c}_j = -1$ exactly; the scramble control proves the identity comb-blind – the arithmetic lives entirely in the identification step. Part B (HJELMSLEV-STRUCTURE-ONLY, 20/20): the chain-ring ladder $R_m = \mathbb{Z}[i]/(1+i)^m$ carries a strictly projective CP tower (certified cb defect identically zero, counts $15 \cdot 8^{m-1} / 35 \cdot 16^{m-1} / 105 \cdot 32^{m-1}$ ) with $\hat{c}_j^{(m)} = -1$ at every level, but the state corner follows the pure register-dilution law $16^{1-m}$ – the wall stays PRIME.FLOOR.PAIRCORR.01, relocated into identification. NO RH claim. |
| v836_commutant_sos_closure.py     | The exact sum-of-squares decider in the five-dimensional abelian commutant: the ansatz $T_{\text{GL1}} = \sum_j V_j^* T_{\chi_j} V_j + \sum_k C_k^* C_k$ over the canonical abelian subalgebra of the 39-dim commutant is closed DEFINITELY by exact certificates – (a) the exact reduction lemma collapses the SDP to a rational LP whose unique feasible point is the trivial diagonal rewriting (Vandermonde kernel $\{0\}$ , exact rationals); no cross-sector positive transfer exists; (b) the rank-3 det form has signature (1, 2), coefficient matching forces $G = \text{diag}(1, -1, -1)$ (not PSD) with the rational dual certificate $q(0, 1, 0) = -1 < 0$ , and $q$ -negative directions are achievable even on the nonnegative cone (832 of 2799 truncation cuts). FENCE-HIT on the positivity branch: the nontrivial version of this route is pair-correlation substance. COMMUTANT-SOS-INFEASIBLE, 29/29; route closed, stop-list entry; the wall stays PRIME.FLOOR.PAIRCORR.01. NO RH claim.                             |
| v837_corner_closure_quantifier.py | The corner-closure quantifier: the two open doors of the character-corner channel class close by opposite mechanisms – Door 1: factor dressings are generically visible but every visible dressing breaks the deployed-form identity by exactly its action on the lock pair (visibility $\Leftrightarrow$ identity defect; the commutant is invisible); Door 2: all 128 characters collapse exactly to 18 classes and read position-blind carrier modes only – the 90-cell class map has NO identity-and-visibility-and-placement cell, and the quantifier extends level-exactly through the Hjelmslev tower to $m \leq 3$ (identity characters exactly $\text{Ann}(\langle S_m \rangle)$ , Vfac spectra $\{1, 0, -1/7\}$ ). The structural half is kernel-checked in TftCarrier/SectorPositiveDescent.lean with IdentificationPositivity as the single named hypothesis. DOORS-CLOSED + LEVEL2-CLOSED, 19/19 + 17/17 + 3; the wall stays PRIME.FLOOR.PAIRCORR.01. NO RH claim.                                                           |

*continued on next page*

| Script                              | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v838_corner_expectation_position.py | The compression toolkit closes and the position-dependent carrier map is extremally pinned: all 5276 subgroup conditional expectations (74259 components) obey the rank-1 dichotomy (exactly 2 identity-retaining subgroups = the predicted pinning criterion; 0 identity-and-visibility violations), the full pinching's only PSD summands are the two pinned sectors (the joint-use kill), and Stinespring-side compressions pay the identity defect coefficient for coefficient. Four state-preserving position-carrier designs all fail the decisive self-consistent-comb null – the deployed-form identity is an EXTREMAL state condition ( $\hat{c}_{GL1} = -1$ locks the entire $C_2$ mass), so identity-true carriers read zero on every self-consistent comb, true or fake. EXPECTATION-CLOSED + POSITION-CARRIER-TRADEOFF, 13/13 + 13/13; the fourth wall coordinate typed; NO RH claim.                                                                                               |
| v839_paircorr_bridge_saturation.py  | The pair-correlation bridge mapped from both sides and the GUE saturation of the floor demand: the demand of PRIME.FLOOR.PAIRCORR.01 written in Montgomery $F(\alpha)$ -form on all 73 frames with every supply row carrying its conditionality tag (Montgomery's window is RH-conditional; unconditional input misses by $52\times$ ; even full GUE closes only 39/73 rungs) – the named minimal missing input: an unconditional $F(\alpha, T) \leq C_F$ out to $\alpha \approx 3$ . The demand/GUE ratio plateaus at $R_\infty = 1.11$ inside the frozen band with $\text{rms}(z) = 0.72$ – the floor demand sits AT the random-matrix boundary of the comb, and inverting the certified margins yields the calibrated form-factor measurement $\hat{F}(\text{win}) = 0.44 \pm 0.14$ (the instrument candidate). BRIDGE-FULLY-BEYOND + GUE-SATURATING, 9/9 + 7/7; NO RH claim.                                                                                                                 |
| v840_gue_ablation_loopgain.py       | The saturation is STRUCTURAL and the bootstrap loop is SHORT: every source-native, Guinand-admissible tower variant lands at the deployed demand/GUE plateau (1.058–1.199 vs 1.154, tol 0.35; 0 broke positivity) with the tight band pinned in the UNFOLDED coordinate $\alpha \in 1..2$ under every lattice – the saturation is a property of the tower class and of the unfolded zeros, not of the grid (the thinned comb breaks positivity; the scramble explodes) – and the certified ladder cannot bootstrap its own next rung: $g = 1/(k^2 R^2 c_{\text{sup}})$ with headline $g(k=1) = 0.529$ and even the IDEAL supply giving $1/R^2 = 0.655 < 1$ ; the Poisson circularity ward passes. The wall's self-conservation IS the saturation: the ladder supplies exactly the statistics of the zeros while the floor demands slightly more. SATURATION-STRUCTURAL + LOOP-SHORT, 10/10 + 8/8; NO RH claim.                                                                                   |
| v841_relation_carrier_ladder.py     | The relation carrier EXISTS: the corner route reopens with the right input class – the multiplicative relations between events. The exact convolution frame carries $\mu * 1 = \delta$ and $\Lambda = \mu * \log$ as exact structure; the four-comb discriminator is exact (true comb 0 EXACT, $h = 2$ Epstein $x^2 + 5y^2$ separates at 200.0 on the class-group obstruction sites, and the reading is Selberg-class-correctly blind between genuine $L$ -functions); ALL FOUR GATES pass, including the self-consistency null that killed every compression and every single-event carrier. The amplitude wiring fixes $L$ -safety automatically, and on all 67 reachable rungs the identified corner's EXCESS over its comb-blind structural skeleton is positive (+2.285 to +3.704) – the sharpest wall form: $\tau_X = \lambda_{\min}(\text{structural}) + \text{EXCESS}$ . RELATION-CARRIER-EXISTS + EXCESS-NONNEGATIVE, 18/18 + 13/13; registers PRIME.RELATION.MULT.01 [O]; NO RH claim. |

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v842_excess_certified_skeleton.py | The certified skeleton of the identified floor decomposition: strictly positive interval enclosures of $\tau_X$ on ALL 67 reachable rungs (widths $5.4 \times 10^{-11}$ .. $6.6 \times 10^{-9}$ , three to five orders below the margin), the certified discriminator (the $h = 2$ Epstein fake certified NEGATIVE on every anchor from the exact rational $\Lambda_F$ recursion), and the honest scaling law: certifiability degrades faster than the margin decays but the horizon $\alpha^* \approx 9.1$ lies far beyond the deployed ladder end – certifiability is not the binding constraint. What remains is exactly the wall: the infinite quantifier over strictly-positive certified enclosures; any future route must supply a UNIFORM lower bound on the excess margin. SKELETON-CERTIFIED, 9/9; registers PRIME.RELATION.SKELETON.01 [O]; NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| v843_margin_law_excess_lean.py    | The margin as a doubly-derived typed law plus the kernel-checked Lean mirror of the wall: $\tau = e_1(\alpha) h^{-3/2} \tau_{\text{pnt}}(\alpha)$ with the certified envelope constant reproduced EXACTLY across two independent coordinate systems ( $e_1 \in [4.855, 24.209]$ on all 67 rungs, $\min \geq 4.335$ – the double-derivation ward; $\tau$ vs $\lambda_{\min}(A_h)$ at $2.1 \times 10^{-12}$ ); the tower gives scale, not recursion (defect series non-decaying); the excess is a growing cancellation (CI median 15.6, rising $5.65 \rightarrow 29.46$ – the wall self-similar at cell level; no per-prime positive control); compiler connection null (0/96, Bonferroni-honest); the ONE preregistered-honest FAIL kept (pairwise $h$ -exponent median $-1.341$ vs bar edge $-1.35$ , not refit). The Lean mirror (TfptCarrier/ExcessSkeleton.lean, lake build green, no sorry): the two-giants decomposition, the interval-certificate and certified-negative discriminator lemmas, the finite-ladder quantifier, the bridge theorem <code>excess_floor</code> with <code>UniformMarginBound</code> the single named hypothesis, and the kernel-checked gap <code>pointwise_pos_not_uniform</code> – no finite certificate table discharges the uniform bound. MARGIN-RECURSES-THE-WALL; NO RH claim. |
| v844_message_doily_rank.py        | The E8 addressing formula and the Doily–Pascal rank theorem, two exact corpus compressions: $M_n = 15 \cdot 2^n = (15, 30, 60, 120, 240)$ certified against the rebuilt objects with one NAMED structure per rung ( $h(E_8) = 30$ derived from the rebuilt root system itself: highest root height 29, marks $\{2, 2, 3, 3, 4, 4, 5, 6\}$ ; 60 Gaussian lines; $120 =  R^+ $ ; $240 = 15 \times 16$ census; coda $248 = 15 \cdot 16 + 8$ ; wrong anchor/multiplier controls fire); and $NN^T = B + 2I$ entrywise for the Cremona–Richmond duad–synthème incidence under the K6 duad bijection, so $\text{charpoly}(NN^T) = (x - 9)(x - 4)^9 x^5$ exactly: $\text{rank } N = 10 = A_\Lambda$ , $\dim \ker N = 5 = g_{\text{car}}$ (the six ovoid indicators SPAN the kernel), multiplicity $9 = N_{\text{fam}}^2$ , top value $3 = N_{\text{fam}}$ , recovery $2/3 = (N_{\text{fam}} - 1)/N_{\text{fam}}$ , six-step $(2/3)^6 = 64/729$ exact – the P2 integers are the singular-value data of the doily incidence; NO $(1/3)^6$ doily mode (v814 typed, no upgrade). MESSAGE-LADDER-EXACT + DOILY-PASCAL-RANK-EXACT, $23/23 + 16/16$ .                                                                                                                                                                                 |
| v845_cfin_normal_form.py          | The finite compiler normal form $C_{\text{fin}} = (V, \hbar, q^*, \sigma, \iota)$ assembled as ONE object read off the Gaussian quotient: the unique selector-picked refinement (16 refinements, Arf 6 + 10), the order-3 family cycle, the parity lift onto $C_{\text{even}}(5)$ with $\beta \equiv \hbar$ and $q_{\text{wt}} \equiv q^*$ ; derived counting $16 = 1 + 5 + 10$ with $ \text{Sp}(4, 2)  = 720$ and $\text{Stab}(q^*) = 120$ faithful $S_5$ , the Pascal reading $(1, 10, 5) = \left(\binom{5}{0}, \binom{5}{2}, \binom{5}{4}\right)$ , the ovoid projective reading, and the budget $240 = 16 \cdot 15$ , $30 = 2 \cdot 15 = h(E_8)$ , $248 = 16 \cdot 15 + 8$ against the actual lattice census. Built-in negative: the exact 128-spinor counting bound ( $\geq 7$ of 15 classes always adjoint-side; the concrete census saturates $8 + 7$ with zero mixed classes) and the weight-level kill re-verify v775 ROOTCLASS-MIXED, not overturned. P2 ( $g_{\text{car}} = 5$ = the $\iota$ slot count) narrowed to the v799 residual R1' ([C]), NOT eliminated. NORMAL-FORM-ASSEMBLED, 28/28 (SPEC v2 declared).                                                                                                                                                                                          |

*continued on next page*

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v846_schur_spectral_mother.py    | The Schur program closed as a typed structural negative: the manifestly positive relational Gram exists (manifest positivity, exact $\mu$ log descent routing with the $h = 2$ Epstein refusal at construction grade, Selberg safety – all green) but the corner identity fails in trace AND form by exactly the forced Cauchy–Schwarz diagonal price (price/ $\tau \sim 3.1 \times 10^4..4.5 \times 10^4$ even at the density-anchored fluctuation floor; the P0 deviation IS the price, structurally) – and the price is GEOMETRY-INDEPENDENT: the unitary spectral mother (the mirror as an operator, $J^2 = I$ ; the deployed form the $J$ -odd Toeplitz compression at rel 0; the Euler product as the exact operator algebra $U_a U_m = U_{dm}$ ) converts interference only at symbol grade (gain 20–33 $\times$ ), never at Gram grade (best legal overhead $5.7 \times 10^4..1.2 \times 10^5 \times \tau$ : the modulus bound). Harvesting cross-event interference is Fejér–Riesz of the total symbol – the positivity being sought: the manifest-positivity route closes on itself. SCHUR-INDEFINITE + SPECTRAL-TV-UNIVERSAL, 19 + 16, zero fails; NO RH claim.                                                                                                                                                                  |
| v847_wedge_cellcone_transport.py | The two remaining v5.4 architecture decisions, honest negatives with typed positive cores: (A) the naive signed Lagrange no-go is EXACT (forced pair weights; $P^-/\det \sim 2.0\text{--}3.2 \times 10^4$ ; the arch block negative definite) while the sign-register lift EXISTS as exact algebra (nonneg wedge weights per frame, LP residual $\leq 8.9 \times 10^{-16}$ , where level A provably cannot) – but the frame-uniform relational law fails at $\sim 15\%$ vs the $4.4 \times 10^{-5}$ floor need: the commutant uniformity wall transported (the honest scramble miss $\times 7.5$ vs the $\times 10$ bar kept, typed); (B) the completed cells telescope exactly ( $3.4 \times 10^{-15}$ ) and obey the congruence identity $\Phi^T J \Phi = cJ$ at $2.2 \times 10^{-16}$ , yet BOTH groupings exit the Lorentz cone on 67/67 rungs at the $n = 2$ cell (endpoint back in-cone = the certified $\tau > 0$ ); the monotone ray cascade to the compiler null direction (5, $-3, 4$ ) is CONFIRMED (Kendall $+1.000/-1.000$ ); the INVERTED Epstein signature kept as the frozen FAIL: the mass-matched fake stays in-cone – the violations are the true comb’s own $\psi(x) - x$ fluctuation. WEDGE-PARTIAL + CONE-BROKEN + RAY-EDGE-CONFIRMED, 13 + 9 with the two frozen-honest FAILS pattern-gated, NOT refit; NO RH claim. |
| v848_extraction_chain.py         | The continuum extraction chain COMPLETE: the implication ‘cofinal finite positivity (H) $\Rightarrow$ Weil positivity $\Rightarrow$ (via Weil’s criterion) the target’ is measured/cited theorem-grade with a QUANTIFIER REDUCTION – no Mosco compactness, no uniform $\delta > 0$ , no diagonal argument enters the implication; per-element convergence is the ONLY analytic input (v816’s three infinite-level ingredients migrate to the operator-level selection programme). Measured: the pure-box class carries the EXACT Weil value at every finite level (err $\leq 5.3 \times 10^{-14}$ – the sharpest dyadic-inheritance statement); identification rates $\sim 4^{-j}$ (median $-1.818$ ); geometric ledger (median ratio 0.302); the X-direction exactly stable (44 cutoff pairs at float zero); controls fire (wrong-limit stall ratio $1.6 \times 10^6$ , scrambled tower inflation $5.5 \times 10^5$ ). Cited with exact roles: Weil 1952, Bombieri 2000, Suzuki arXiv:2606.09096, Iwaniec–Kowalski Thm 5.12. Hypothesis (H) is NEVER evaluated – the arithmetic wall is EXACTLY (H) and nothing else. EXTRACTION-CHAIN-COMPLETE, 19/19; registers PRIME.EXTRACTION.CHAIN.01 [O]; NO RH claim.                                                                                                                              |

| Script                           | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v849_cfin_unique_cofinal_lean.py | The compiler object is UNIQUE and the RH-side wall hypothesis is formally minimized: all 14400 admissible tuples at $\omega = \hbar$ form ONE $\mathrm{Sp}(4, 2) \times S_5$ orbit (orbit-stabilizer $14400 \times 6 = 86400$ exact), $\mathrm{Aut}(C_{\mathrm{fin}}) \cong C_6$ (faithful into $\mathrm{Sp}(4, 2)$ , the slot permutation determined), and the strict terminal-object reading fails honestly (unique up to NON-unique isomorphism, a one-object groupoid). The kernel-checked mathematical core in TfptCarrier/CofinalWeil.lean proves the $\varepsilon/2$ implication with NO diagonal argument and the strict hierarchy uniform $\subsetneq$ pointwise $\subsetneq$ cofinal, formally demoting UniformMarginBound. Hardening 2026-08-13: TfptCarrier/CofinalPredefinition.lean proves an explicit-fixed-idx API, exhibits an old-payload sign-mining counterexample, and makes PREDEFINED a named abstract Predefined( $A, \mathrm{idx}$ ) certificate in the hardened wrapper. Binder/field order is not computational noninterference; the concrete source boundary remains external without a formal construction language. CFIN-UNIQUE, 22/22 + 4 historical mirror checks; NO RH claim.                                          |
| v850_completion_tax_flow.py      | The two class-level no-go closures: EVERY positive 2-sector dilation routing the arithmetic through the fixed comb coupling block pays $\mathrm{tr} P + \mathrm{tr} Q \geq 2\ R_X\ _*$ with equality at the SVD pair (zero-duality-gap certificates on every anchor; symbolic $2 \times 2$ gap $2.7 \times 10^{-51}$ at 50 dps), the bound is BASIS-INVARIANT (DFT/Mellin, mirror $J$ , orthogonal: $\leq 1.1 \times 10^{-15}$ – the spectral-mother verdict becomes a corollary), and the per-cell tax exceeds $\tau_X$ by $\geq 4057.6$ on all 67 rungs (max $7.5 \times 10^5$ , growing $\sim h^{0.24}$ vs $h^{-3/2}$ ); the measured Schur prices exceeded the exact class optimum by only $13.7\text{--}20.4\times$ – optimality could not have saved them. The spectral-flow route closes by measurement: the density endpoint is NOT PSD ( $n_- = 5..12$ , premise corrected), all 634 crossings are upward and endpoint-determined on 67/67 rungs, and the velocity test (median ratio 1.00) shows the amplitude gap IS the metric margin rescaled by the flow velocity – no quantized protection; the typed residue: eigenproblem-free pivot certification and the crossing-location law. TAX-GAP + FLOW-CROSSINGS, 15/15 + 11/11; NO RH claim. |
| v851_cluster_kernel_field.py     | The cluster route closed and the cone violations resolved into a GRADED kernel law: the connected cluster expansion is exact (sympy telescoping; Möbius elimination; $2^{16}$ -subset ward 0.0) but its weights are position-geometric ( $E_2 = 0.883$ vs bar 3.0; the scramble does not collapse them) – the all-orders route through this pivot closes; the strict violation census wanders ( $P_0 \sim X^{1.03}$ , $R^2 = 1.00$ , max 244333/283607 vs cap 100) while the depth- $10^{-2}$ G1 kernel is bounded by $n \leq 73$ on ALL 67 rungs (collapsing to $\{2, 3\}$ above $\alpha \approx 3.9$ ); the causal Lorentz tube field transports clean (0/355199 gated violations on all four rule $\times$ grouping combinations, $\mathrm{cond} \leq 57.3$ ) but is self-calibrating (all four must-break controls do NOT fire – typed surprise); the skin-depth law $D(X) = 0.754 X^{-0.548}$ ( $R^2 = 0.99$ , Kendall $-1.00$ ) with verified threshold $X_0(\varepsilon)$ turns the wandering into vanishing-depth skin – the graded kernel+tail theorem candidate registered as PRIME.CELLCONE.GRADEDKERNEL.01 [O]. CLUSTERS-DIFFUSE + BOTH-PARTIAL + KERNEL-GRADED with the SIX frozen-honest FAILS pattern-gated, NOT refit; NO RH claim.      |

| Script                        | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v862_defect_polar_weld.py     | The rank of the wall is ONE: the defect operator $\Delta = I - C^*C$ has exactly one soft mode on every rung ( $\lambda_1 =$ the $\tau$ -margin exactly, separation 3.9–14.1 $\times$ ) – the Redheffer Smith invariant, the vacuum code’s one-qubit price and the Krein soft port are ONE rank-one structure; the MONOMIAL CLOSURE THEOREM: every source letter is monomial, the class is product-closed, the contractor’s monomial mass is 0.23–0.24, so EVERY word of ANY length misses by $\geq 0.874$ (the 408 sign flips kill the band-corridor form, typed v2); the 2-torsion weld law: the deck’s anticommutant is entirely faithful- $\mu_4$ – the deck welds only as $J = MD$ ; all four candidates weld exactly, the unwelded control refuses exactly, and the contractor connection is null ( $\sqrt{2}$ ) – the weld supplies the TYPE of the missing letter, not its value.                                                                  |
| v863_redheffer_colligation.py | The colligation architecture: both source-built 16-slot machines are exactly unitary, the vacuum-port Redheffer closure makes every closed transfer block AUTOMATICALLY contractive ( $\sigma_{\max} \leq 1 + 10^{-9}$ , never tuned), and the scalar limit reproduces the weighted lattice Redheffer determinant EXACTLY – the discovery: $\mathbb{F}_2^4$ IS the divisor lattice of $210 = 2 \cdot 3 \cdot 5 \cdot 7$ with Walsh–Hadamard carrying the lattice Möbius function and $\det = \prod_p (1 - 1/p) = 8/35$ exact; the machine is provably comb-blind (anti-circularity ward); the identification gate fails honestly (best residual 1.38 vs bar $10^{-8}$ ) with the gap typed exactly: the contractor couples DIFFERENT $ \tau $ density bands while the $J$ flip couples equal $ \tau $ (transfer mass 0) – the missing object is the grid-side band intertwiner, the explicit-formula kernel itself.                                        |
| v864_softport_kappa_law.py    | The scalar reduction: the exact Feshbach/Schur reduction turns the matrix floor into ONE port impedance ( $\tau > 0 \Leftrightarrow s > 0$ ); four source ports pass with the cheating-port ceiling $\kappa \equiv 1$ exact; the pole port carries 84% of the soft mode at depth with the exact skeleton $\kappa^{-1} = \beta^2 + \lambda_1 \rho$ ( $1.2 \times 10^{-9}$ over all 42 rungs) and the closed-form $a$ -term (the Poisson/Cauchy average of the signed density at $s = 1/2$ ); the law $\kappa - 1 \approx 6e^{-\alpha/2} \rightarrow 1$ (Pearson $-0.986$ ); the backflow concentrates on $\leq 17$ bulk modes cancelling 99.9% of the $a$ -term – the classical shape exists, the boundable term is exactly the arithmetic; displacement rank $\sim 12$ fixed over a $3.9\times$ dimension range with arm-weight generators; pure rank- $\leq 2$ Cauchy excluded; both discriminators break at the premise.                                 |
| v865_weyl_port_readout.py     | The arithmetic impedance: the divisor-tower Weyl load carries the comb at $O(1)$ (median $ dm / m  = 0.757/0.456$ under mass doubling – the hull’s comb-blindness REPAIRED at load level) and the v1 extremal readout dies by a diagnosed mechanism: doubling is a near-reparametrization $m \rightarrow m(z/2)/2$ of the $r$ -curve (curve-set distance 0.0287/0.0017), and extremal functionals read the curve as a set; the repair passes anti-blindness at the frozen bars and the phase readout closes the loop: $\kappa$ band $\leq 4$ across the battery AND Epstein $\kappa = 42.7$ / scramble 77.6 outside the $1.5\times$ truth window – 1–2 orders of discrimination where every earlier functional had both inside; the typed caveat carried verbatim: Spearman( $s, \tau$ ) = $-0.8$ – the load-bearing content is the discrimination, not the band; the two frozen-honest FAILs of the port probe are the diagnosis, kept and pattern-gated. |

|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v866_source_contractor_formula.py | THE FORMULA (the campaign's headline): the Douglas contractor factors EXACTLY as the target-free closed-form source expression $C = W_- F G_+^{-1} F^H W_+$ ( $1.4 \times 10^{-14}$ on construction rungs AND blind holdouts; no zeros, no $\tau$ , no fit) with CERTIFIED defect transfer ( $ \text{defect}(C_{k^*}) - \tau $ within the Weyl budget on all 7 rungs); the frozen Sylvester-12 kill fires as designed (principal angles $89^\circ$ ; the rank-12 reading corrected to $\sqrt{L}$ growth, $k^* = 24.48$ ); the norm statement is the reformulation $\ C\  \leq 1 \Leftrightarrow G_- \preceq G_+$ EXACTLY – better coordinates, the same wall – and the PERRON CLOSURE is proven: $\rho( C ) = 2.4\text{--}3.1 > 1$ everywhere, so NO absolute Schur/Hilbert-type inequality can ever certify – cancellation provably carries the arithmetic; the named demand (PRIME.KREIN.CONTRACTOR.01 [O]): a PHASE-AWARE bound on the weighted frame kernel strong enough to beat 1 by the measured $e^{\text{slope } \alpha}$ margin – the single object that would discharge the SourceContractor hypothesis. |
| v867_radau_conditioning.py        | The quadrature reach: Gauss–Radau certificates for $s > 0$ EXIST on EVERY rung ( $a - U_m \geq 10^{-8}a$ at $m^* \leq 426$ – the kz-16 Neumann frontier killed: positivity is provable pointwise by quadrature alone on the whole ladder $h \leq 900$ ) but the depth grows with the certified law $m^* \sim \sqrt{\text{cond}(G)}$ (Spearman +0.99); the $m \approx 17$ prediction honestly failed (0/7 rungs – the value concentration is not a certificate); all three source preconditioners fail informatively (condition medians grow $59\text{--}75\times$ ; congruence exact; Sylvester control: no healing); the conditioning is INTRINSIC – the soft end of the bulk is distributed arithmetic structure, and the certificate depth is the price of the cancellation; $J_\infty$ NAMED: the free Chebyshev chain on the bulk support (Rakhmanov-generic typed); both frozen-honest FAILs kept and pattern-gated.                                                                                                                                                                                          |
| v868_divisor210_audits.py         | The hard canonicity guard for the 210 discovery: the Boolean/Walsh/ $\mu$ layer is measured GENERIC exactly as warned (210/210 quadruples pass it), the deployed Euler constants pin $\{2, 3, 5, 7\}$ UNIQUELY (both scalar-limit determinants, exact Fractions / exact radical maps, one match each), the anchor prime 2 is FORCED by the frozen ramification crossref (the unique $\mathbb{Z}[i]$ -ramified prime onto the unique $\sigma$ -fixed $q^* = 1$ class), the $\mu_4$ weld grade cuts the gauge $C_6 \rightarrow C_3$ , and after R3 exactly TWO gauge classes remain – the family-cycle chirality, which is then PROVEN gauge by two exact no-go wards (the register orientation functional vanishes identically via the Möbius complement $d \mapsto 210/d$ ; quadratic readouts are provably chirality-blind by transposition); the $17 = 12+3+1+1$ moving-12 identification is honestly buried at space level (principal angles $\sim 90^\circ$ vs the $10^{-6}$ bar – a COUNT, not a space match); the 6-vs-7 honesty note stands untouched.                                                       |
| v869_cdcore_clarkphase.py         | The kernel is NAMED: $K_+$ is exactly the Christoffel–Darboux kernel of an explicit source measure in $x = 2 \cos(D\tau)$ – the displacement rank collapses from the growing $\tau$ -budget (12–14, the $\sqrt{L}$ law) to EXACTLY 2 with a $6.6 \times 10^{12}\text{--}4.8 \times 10^{13}$ gap on all 7 rungs incl. blind holdouts, and the firewalled chain-only CD reconstruction rebuilds $C$ at $\sim 10^{-13}$ – the contractor = arm weights + phase/geometry factors + ONE source Jacobi chain (honest boundary: the rank-2 collapse is window geometry, the controls collapse too – the arithmetic lives in the chain and the weights, $O(1)$ different for the fakes); the $\mu_4$ quarter-turn Clark phase is falsified sharply: the EQUAL-PHASE coupling law (offset $\sim 0^\circ$ at $\bar{R}$ 0.97–0.99, not $90^\circ$ ), the phase coordinate itself source-only clean.                                                                                                                                                                                                                            |
| v870_christoffel_gauss_frame.py   | The factorization and the frame decision: $C = D_- U D_+$ assembles exactly ( $10^{-14}$ ) with $D_\pm$ stably contractive ( $\ D_+\  \leq 0.9654$ by the Christoffel variational theorem; $\ D_-\  \leq 0.8655$ measured) and $U$ non-unitary BY THEOREM (the deployed grid $2\times$ -oversamples the folded pairs – rows $\geq 1.158$ , the $\sqrt{2}$ over-normalization); the Gauss-node frame is exact where algebra promises ( $D_+^G = I$ at $5 \times 10^{-11}$ , lossless bridge, frame-invariant port share) yet the unitary core does NOT exist (co-isometry defect $O(1)$ , cross-measure node misalignment at near-pole pairs); the surviving asset: $D_-^G \leq 0.997041$ ladder-wide with $34\times/2900\times$ discrimination; the named hypotheses (H-D)/(H-U)/(H-PORT) registered.                                                                                                                                                                                                                                                                                                               |

| v877_complete_comb_reversal.py     | THE ARTIFACT RESOLUTION AND THE COTLAR REVERSAL: the deep-alpha negative floors were comb-truncation artifacts of the deployed atom table (silent cap at $4 \times 10^5$ ; the windows demand support to $1.8 \times 10^6$ ) – complete-comb certified enclosures strictly positive ( $+1.1\text{e-}5/+1.5\text{e-}5/+1.2\text{e-}5$ ), no negative canonical window, $H_{\text{cof}}$ unaffected; and under the IDENTICALLY frozen v1 bars the complete-comb deep sums collapse into the battery band (kz 142: $S_U$ 32.07 $\rightarrow$ 5.65; slopes 0.006/0.007 $\Rightarrow$ BOUNDED): the v1 kill was entirely the artifact, run 3 unlocks and passes ( $K_1/K_2$ $h$ -stable), the route REOPENS – the dated round-36 correction on PRIME.KREIN.CONTRACTOR.01, with v873's booking standing as the record of the preregistered v1 execution and the remaining gap typed ( $B_C \sim 4$ vs 1; local defects 7–10). The truncation audit retypes every affected finding.                                                                                                                                                                                                                                                                                                                                                  |
| v878_ledger_integrity.py           | THE STATUS-LEDGER INTEGRITY GUARD: round 36 found and fixed the first primary-key violation (claim_id FORM.QGEO.03 double-booked 2026-06-15/2026-06-18; the SeamDeckClosure row renamed FORM.QGEO.04 with a dated QA note, all references updated); the guard enforces the 10-column schema, global claim-id uniqueness (the fix pinned), existing supersession targets with an ACYCLIC supersession graph, unique active supersession targets modulo the frozen remove-only allowlist of the two legitimate 2026-06 joint closures, and the dependencies cross-reference census frozen remove-only (13 SCCs / 265 ids; acyclicity enforced as NO NEW CYCLES).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| v879_envelope_partition_closure.py | THE PARTITION CLOSURE: the analytic core saved – multiplication by $\cos \theta$ acts EXACTLY tridiagonally on the odd frame (single rank-2 defect at $k = 0$ ; the CD telescoping identity at $1.3\text{e-}13$ on every rung incl. all five complete-comb holdouts) and the derived pointwise bound carries $h$ -UNIFORM source constants ( $C_{\text{int}} \in [1.23, 2.33]$ from $h = 168$ to 1445, slope $+0.106$ – the route's first analytic uniformity statement, entrywise grade); the cell-envelope decay is cancellation-carried and provably NOT entrywise-derivable; no predeclared cell accounting below 3.57 (bar 1), $\sum_r \varepsilon_r \approx 12$ $\alpha$ -uniform on clean deep data. The wave-packet decision: both designs honest tight frames ( $\ B\  = \ C^G\ $ exact), the Gabor envelope decays in phase space (the first partition to show decay), discrimination 5 vs 129 vs 9007 – but diagonal mass $\leq 18\%$ under ANY pairing and the Schur constant grows 4.9–9.2 (slope $+0.295$ ): the partition class is closed ENTIRELY (cells, packets, all frames), the cancellation is ATOMICALLY GLOBAL, and certificate routes must be NON-DECOMPOSITIONAL (eigen-enclosure / Loewner order / passivity – all three measured territory); the two frozen-honest FAILs pattern-gated, NOT refit. |
| v880_finite_anchor_theorems.py     | the four finite anchor theorems: the census-free normal form $q^*(x) = \sum_{i < j} x_i x_j + \sum_i x_i = \binom{ x +1}{2} \bmod 2$ (weight-only; the selector forced on the linear part); the EXCLUSIVE anchor classification of $PG(3, 2)$ lines (all 15 doily lines carry $\{2, 1, 1\} = a$ , per-line Vieta (4, 5, 2) with $e_2 = g_{\text{car}}$ , $e_3 =  \mathbb{Z}_2 $ ; 10 secants carry the WRONG anchor (1, 2, 2), 10 external lines (1, 1, 1)); the doily as the multiplication table $\Lambda^2 E \times \Lambda^2 E \rightarrow \Lambda^4 E$ (wedge nonzero EXACTLY on doily lines); one-step quadratic exhaustion FORCES $g = 5$ ([E] theorem; the Calderón premise stays [O]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| v881_carleson_port_geometry.py     | the exact operator geometry of the Carleson wall – four sides of ONE object: the literal rank-2 Pick target REFUTED and replaced by the exact rank-2 Jacobi displacement ( $4.3\text{e-}14$ , source-only, blind holdouts); the gauge identity $E = S(\sqrt{\tilde{\nu}} K_{\text{CD}} \sqrt{\tilde{\nu}}) S$ – the wall is orthogonally equivalent to the plain Carleson Gram with the CLASSICAL testing diagonal $\tilde{\nu}_m K_h(y_m, y_m)$ (phases are gauge); the Schur/Haynsworth port reduction with $(1 - \lambda_{\text{max}}(D_P))/\tau = 1.00$ on ALL rungs (the port IS the wall); and $[Y, D_P]$ of EXACT rank 2 – the dressing preserves the IKS integrable class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*continued on next page*

| Script                            | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v882_port_source_mellin.py        | the universal source law of the port: under $r = \sqrt{n/X}$ the weighted prime measure uniformizes to Lebesgue $dr$ (Kolmogorov $5e-4$ at $X = 10^7$ ); the last-log-unit edge mass equals $1 - e^{-1/2} = 0.393469$ (measured $0.3936$ ) – the wall’s port mass IS the PNT edge law; the port symbol is the Mellin–Cauchy kernel $1/(1 + 2i\tau)$ and the FIT-FREE continuum prediction reproduces the deployed port numerators to $0.029$ at the deepest rung (the deviation = the shrinking arithmetic fluctuation); the port numerators are the EXACT windowed prime sums and the criticality budget CLOSES ( $+1.405 - 1.674 + 0.284 \approx 0$ ): the wall is an ERROR-TERM statement about prime partial sums at the port frequencies.                        |
| v883_tau_chain_parametrix.py      | the determinant chain to the tau function and the GLOBAL rigidity of the Euler-product comb: the Schur identities $\sigma_h = \det(I - E)/\det(B)$ and $\det(I - E) = \det(I - R)\det(I - D_P)$ are machine-exact ( $4.8e-13$ ), hence $\text{sign } \tau_h = \text{sign } \sigma_h$ = the wall with $\tau_h := \det(I - D_P)$ ; the Jacobi variational identity holds on the true family; the parametrix decision: lattice-with-smooth-masses and even exact-local-PNT-mass worlds are ORDERS worse than the continuum against the true comb, and BOTH zones (edge and interior) are load-bearing – the Euler-product pairing is globally rigid, every smoothing-based parametrix is dead.                                                                           |
| v884_certified_head_positivity.py | the first RIGOROUS positivity statement of the program: $\sigma_h > 0$ PROVEN on the head rungs kz $9/12/13$ by exact integer Bareiss/LDL Sylvester certificates on the $Q = 10^{20}$ grid after an independent mpmath rebuild of the window lags with a conservative error model (shift $\sim 2e-18$ , 14 orders below the certified floors $\lambda_{\min} \geq 3.3e-4$ ); the Epstein control is REFUSED by the identical machinery; typed honestly: proven modulo the declared transcendental-evaluation error model (validated-numerics standard).                                                                                                                                                                                                               |
| v885_ladder_flow_anatomy.py       | the flow/induction anatomy of the ladder: the gauge-fixed IKS generator flow closes in DEGREE 2 (residual medians $0.244/0.248$ with $\{Y^2f, Y^2g\}$ ; degree 1 fails) – an isomonodromy-compatible Lax structure typed honestly as structural precondition; the window-ladder step is marginally perturbative but non-monotone in raw $h$ ; the ONE-PRIME ladder decides: the pure-Arch start is catastrophically subcritical, the last sign crossing sits at $u^*/U = 0.991-0.999$ in EVERY insertion order and edge-first needs 100% of the atoms – POSITIVITY IS A PROPERTY OF THE COMPLETE COMB (no monotone one-prime induction exists); the raw degree-2 coefficient basis is ill-conditioned noise, so the natural flow coordinate is the named open object. |
| v886_register_gapcode_null.py     | DISENCHANTMENT ROW: the error-code reading of the 210-register is literally true on the prime side – the register bits $\{2, 3, 5, 7\}$ are exactly the first four parity checks of the sieve (rate $48/210$ , 16 syndrome labels, message capacity 0 bits; hard floor $g_k \geq w(p_k \bmod 210)$ with 0 violations in $5.76 \times 10^6$ pairs) – AND the code is the sieve, not a TFPT signature: a zero-parameter wheel–Cramér null explains $R^2 = 0.99839$ of the state profile, the arithmetic excess is 4.02% and shrinking, there is no knee at four checks, and 210 sits on the foreign-wheel trend; nothing moves with $c_3$ or $\varphi_0$ .                                                                                                              |
| v887_certified_ladder_complete.py | the COMPLETION of the certificate rollout: $\sigma_h > 0$ is now PROVEN on ALL 42 reachable rungs – this module closes the last two rungs $h = 859/878$ (validated-precision Cholesky dps $120/200$ with precision doubling; certified floors $\geq 8.4e-6/9.2e-6$ ; pivot/bound ratios $\sim 10^{115}/10^{195}$ ); the Epstein control is REFUSED at pivot 10; proven modulo the declared conservative evaluation error model.                                                                                                                                                                                                                                                                                                                                       |

| Script                                    | What it machine-checks ( <i>continued</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v906_tail_<br>cartography.py              | the tail mechanism map (typed explicitly as mechanism/negative cartography, NOT progress): five dead routes with named seats – the tail sign is NET-ONLY, not pointwise; the pointwise repair grows with the window ( $X^{0.89}$ ); the directional Loewner route dies by the floor-vs-inverse mechanism ( $q \leq \bar{q}$ exact but $n > \bar{q}$ falls 38/39, loss med 91.3); the cumulative/Abel route is exact but insufficient (gap law $e^{+1.744\alpha}$ ; the real hole is the OSCILLATION); the segment split is COSTLIER than global (the anchor price; the named missing object: a DIFFERENCE envelope for $\psi(y) - \psi(x) - (y - x)$ on short deep windows, Brun–Titchmarsh/Selberg class) – and two structural positives: HEADFLOOR-O1 (the whole $h$ -decay of the wall margin lives in the atom tail; the open statement is the one-sided bound $\text{tail}_B > -\text{head}_B$ between two $O(1)$ objects) and the 12-bin reduction (the tail bound as a statement about $\sim 12$ windowed $\psi$ -fluctuation Fourier coefficients, measurably NOT $\gamma$ -concentrated at these depths; the reduction changes the DIMENSION of the open statement, not its difficulty). |
| v907_halfgap_<br>registered_<br>target.py | the registered half-gap target and its first blind holdout – a FALSIFICATION instrument, explicitly NOT evidence for RH: the target inequality $n_h - q_h \geq \frac{1}{2}\mu_1(h)$ registered on the 67-rung surface with the constant EXACTLY $\frac{1}{2}$ frozen under an explicit NO-ADJUST clause (part of the registered object), surface pass 67/67 (min margin $+2.48\text{e-}3$ ), blind protocol declared (registry sha ae292e55), the four candidate origins of the $\frac{1}{2}$ typed OPEN – an algebraic derivation is demanded before any claim upgrade; the FIRST genuine blind holdout passes: 28 new deeper faithful rungs ( $h$ 1219..2854, bit-exact table fidelity), 28/28 with min margin $+0.2232$ ( $\sim 90\times$ above the surface minimum – no depth erosion), HEADFLOOR-O1 persists (with the honest cut-ladder drift disclosed), B-floor/ $P_G$ persist at declared float level, the margin law continues ( $p = -1.925$ over 95 rungs); controls discriminate 3/3; a pass is survival of a falsification attempt, never evidence.                                                                                                                                 |
| v908_seam_<br>equilibrium_<br>wiring.py   | the seam equilibrium wiring (the physics closure of the round-60 questions): strict 2-cycle RP is IMPOSSIBLE on the whole C6-covariant class (the seat law reduces exactly to $M_1 = \text{diag}(a_J, -a_J)$ , interior EMPTY – the marginal witness is neither a limit of covariant strict equilibria nor isolated); the only escape is the covariance-breaking $X$ coordinate at exact linear price $2\varepsilon$ , with the floor exchange $\text{Pf}_4(\varepsilon) = (\varepsilon - \frac{1}{200})(\varepsilon + \frac{1}{200})$ exactly – the canonical sign gate IS the negative effective RP margin; the strict-collar obstruction is a two-seat linear law with kernel $\{J, Z\}$ , the deployed wiring is PURE-I (maximally obstructed), and equilibrium witnesses $V_J/V_Z$ carry the full $1/200$ mixing at ZERO entropy production – NO NESS NEEDED (stationary $\Rightarrow \sigma \equiv 0$ exactly; drive buys no RP); the registered next contract – is PURE-I compiler-forced? (SEAM.STATE.WIRING.SELECTOR.01) – is CLOSED in v911: deployment choice, not a compiler theorem; the v898/v903 [O] premise unmoved.                                                              |

|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v912_form_convergence_theorem.py      | the form-convergence theorem: the per-element convergence premise of the extraction chain – until now typed MEASURED (corpus rates $-1.58..-1.84$ per level, v848) – is proven UNCONDITIONALLY on the deployed dyadic cellwise-affine family with explicit rate $O(D^2 \log(1/D)) = O(2^{-2j}j)$ and explicit constants ( $\Theta_0 = 3 \log 2 + \pi/2 + \gamma + \log \pi$ ; for continuous $f$ the log coefficient is exactly $7/24$ ). Mechanism: the deployed lag vector IS the capped Weil functional on the even tent, so the finite form equals $W_C[\tilde{K}_D]$ exactly; midpoint exactness on cellwise quadratics makes the nodal defect exactly $-(D^2/12)G(dD)$ (zero deviation in exact rationals over 1474 lag identities and 780 interior points); the faithful cap turns the error into $W_C$ of ONE explicit function, bounded by elementary majorants per layer. Sharpness measured against a closed-form leading term (ratio $0.575..1.066 \rightarrow 1$ through $j = 18$ ). Audit correction: the chain's cited pure-sup-norm $C^0$ -continuity of $Q_W$ is FALSE (control C5, explicit counterexample family); the true hypothesis is uniform convergence plus equi-Lipschitz/Dini at the origin, supplied by the admissible BV class. Only cited arithmetic input: Rosser–Schoenfeld $\psi(x) < 1.03883x$ for support uniformity, independently sieve-verified to $10^7$ . Pinning (meta-audit CCCXXXVI): the W1 dictionary, Weil's explicit formula and criterion, the admissible class with the density leg, the all- $x$ Rosser–Schoenfeld statement and the universal quantifier are CITED, not pinned by these gates. DELTA-A: <code>CofinalEnvelope.lean</code> states the envelope premise and derives <code>hconv</code> from it, so the Lean hypothesis is the instantiated envelope, but the envelope is not discharged inside the kernel. Closes the convergence edge only; the cofinal positivity inequality is untouched and RH-hard; NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| v913_signed_alignment_localization.py | the signed-and-alignment localization: a NO-GO / typing module that prices ARGUMENT CLASSES and supplies no positivity, no interval and no certificate. Any argument that closes the deployed budget inequality (L) for the deployed budget shape must be SIGNED – it must orient a quantity that is odd under the comb sign flip – and ALIGNMENT-CARRYING – it must relate the position of the prime atoms to the spectral directions of $K$ ; in particular it can be neither a magnitude bound on $\psi(x) - x$ nor a natural-grammar identity valid in every arithmetic world. Promoted core, exact and self-contained: the six kernel identities (notably $\ K'_D\ _1 = 4$ independent of $D$ , so the conversion constant of a magnitude hypothesis does not get cheap as the mesh refines), the two-route supply recomputation, the Littlewood emptiness of the magnitude class (floor/slack 214.7 on this module's own conservative slack, 1527.1 on the deployed slack), the provable neutrality of Selberg's symmetry formula, the exact split algebra with its congruence invariance and comb-flip parity, and the Beurling–Nyman transport target in exact arithmetic (no $N$ -uniform Gram floor; explicit non-implying family). The deployed matrix-stage reads stay in <code>experiments/</code> : they inherit the float64 entry-slack premise and the cited ladder. Pinning: the identities, split algebra, Selberg neutrality, Beurling–Nyman witnesses, supply recomputation, own sieve, frame rebuild with predicted $h$ and the reproduced probe SPEC-SHA are PINNED; the deployed ladder and its certified reads, the deployed entry slack, Littlewood's $\Omega$ -theorem itself, the float64 slack premise, the deployed budget shape, the four premises of the reverse implication and the counter-evidence corpus are CITED. Counter-evidence carried unsmoothed: the certified reads are positive at all nine depths (deepest $2.79579794131272506e-15$ at $h = 12632$ ), the normalised decay flattens with depth and one re-derived step is positive, so the drift is not monotone. Ten classes are proven empty for this budget shape, five are merely unexplored and five clauses are named open; the statement is finite-rung and makes no all- $h$ claim. It does NOT say that RH is unprovable, that the wall route fails, or that no proof exists; it closes no gate, narrows no gate, moves no marker and must not be counted as progress. NO RH claim. |

| v914_pascal_region_theorem.py      | <p>PRIME.PASCAL.REGION.THEOREM.01 [E]: the Pascal-region theorem, the largest proven positivity region of the prime-front campaign, promoted as a certified-finite result (18/18). Statement, proven from cited external inputs alone: with <math>a = 256</math> and <math>y_\rho = a/(a - (\rho - 1/2)^2)</math>, <math>C_{n,k}(256) = \sum_{\text{Im } \rho &gt; 0} y_\rho^{n+1} (1 - y_\rho)^k &gt; 0</math> for every <math>n \geq 0</math> and every integer <math>0 \leq k \leq 7,444,682,106,464,286,365,865</math> (<math>\sim 7.44 \times 10^{21}</math>). Cited inputs, pinned: Platt–Trudgian 2021 Thm 1 (<math>T = 3,000,175,332,800</math>), Hasanalizade–Shen–Wong JNT 235 (2022) Corollary 1.2 (<math> N(t) - M(t)  \leq 0.1038 \log t + 0.2573 \log \log t + 9.3675</math>, <math>t \geq e</math>; the round-110 attribution flag resolved – Cor. 1.2 is the <math>N(t)</math> bound used, Cor. 1.4 the companion <math>S(t)</math> bound, the old (0.110, 0.290, 2.290) constants the earlier <math>S(t)</math> bound with the invalid Cheng–Graham input), Rosser 1941 Thm 19, the classical <math>\gamma_1</math> isolation. Stage 1 (<math>k \leq 10^{19}</math>) fully recomputed in-run (four-region partition, <math>B_0(T)</math> anchored, ratios <math>1.876981097339/1.176577026464/335.8/1416.8</math>, mechanism root <math>k^* = 1.405443828790708 \times 10^{19}</math>); Stage 2 (to <math>k_{\max}</math>) via retained-<math>q^k</math> envelope, 16384-packet RvM lower bounds below <math>H = T - 1</math>, alternating Gaussian-log tail enclosure above <math>T</math>, and the pinned 33-cell run-of-record endpoint partition with a frozen 6-cell full-packet recompute including the worst cell (endpoint ratio 1.000001535385559; the next <math>2 \times 10^{-6}</math> step fails – mechanism-exact). The law recomputed: <math>k_{\text{front}}(T) = (\lambda_\infty + O(1/\log T)) T^2/(a - 1/2)</math>, <math>\lambda_\infty = 0.226987054723979955</math> – verification height <math>qT</math> buys <math>q^2</math> columns; <math>k_{\max}/k_{\text{geo}} = 0.2113215513454976</math>. Honest typing (round-108): verification-powered and FORM-LOCAL – zero-location content below <math>\gamma_1 = 14.13</math>; says nothing about screw sections or Weyl disks; the <math>k \rightarrow \infty</math> quantifier untouched; no wall positivity, no zero table, no zeta evaluator. NOT evidence for or against RH. NO RH claim.</p> |
| v915_eulerpick_certified_floors.py | <p>PRIME.EULERPICK.CERTIFIED.FLOORS.01 [E]: the certified Euler–Pick floors <math>N = 1.4</math> – outward-rounded interval positivity certificates for the first four rungs of the falsification ladder, with a disclosed recomputed/pinned split (15/15). Object (V0c, audited round 92): <math>P(\sigma) = \xi'/\xi(1/2 + \sigma)</math>, <math>\sigma_j = 1 + 1/j</math>, <math>\mathcal{P}_N = [(P(\sigma_j) + P(\sigma_k))/(\sigma_j + \sigma_k)]</math>; RH iff <math>\mathcal{P}_N \succeq 0</math> for all <math>N</math>; the forward direction is exact, so a certified positive floor is an unconditional finite RH-consequence check from prime data alone and a certified negative rung would be an RH-disproof candidate. Recomputed in-run (round-95 architecture verbatim; own sieve to <math>1.6 \times 10^7</math>, outward interval arithmetic end to end, certified digamma, Büthe/RS tail, Weyl + interval Cholesky per Rump 2010): cap <math>4 \times 10^6</math> certifies <math>N \leq 2</math>; cap <math>1.6 \times 10^7</math> certifies <math>N \leq 3</math> (<math>\log_3 = 2.3643695 \times 10^{-10}</math>) – the round-95 record reproduced, all three cited <math>\psi</math>-bounds (Büthe 2018, Rosser–Schoenfeld 1962, Nair 1982) warded against own sieve data. Pinned from run-of-record (the 45-minute compiled <math>10^{13}</math> sieve): <math>N = 1</math>: <math>[4.5917135 \times 10^{-2}, 4.5917136 \times 10^{-2}]</math> down to <math>N = 4</math>: <math>[8.278338 \times 10^{-15}, 1.3840906 \times 10^{-14}]</math> (margin 0.749) with <math>\pi(10^{13}) = 346,065,536,839</math> reproduced exactly; consistency, corpus parity, the re-derived summation-error model, the Nair far-floor necessity (<math>X_{\text{req}}(4) = 10^{11.52}</math>) and the <math>N = 5</math> knowledge wall all gated. Honest typing (round-108): the channel is DISPROOF-SOUND but REACH-CAPPED – the certified slice sees planted off-line pairs only at <math>\gamma \sim 5</math>–8 (recomputed detection subset), far below Platt–Trudgian <math>3.0 \times 10^{12}</math>; zero live falsification power in the certified range; “open and empty” is a theorem given the cited inputs. NOT evidence for or against RH. NO RH claim.</p>                                                                                                                                                                                                    |

| v916_epstein_weil_violation.py    | PRIME.KR4.EPSTEIN.COLLAPSE.01 [E]: the certified Epstein Weil-positivity violation (20/20). Statement, recomputed at every suite run: an explicit sha-pinned unit test vector (len 1038, sha b01436d53d2cbbec) whose tent autocorrelation $\psi_x = h_x * \tilde{h}_x \geq 0$ pairs NEGATIVELY with the source data $-g''_Q$ of $Q = x^2 + 5y^2$ : $V = x^T T x = -1.9697 \times 10^{-2}$ , error budget $\leq 4.3 \times 10^{-68}$ , two-precision (dps 80/110) agreement $9.8 \times 10^{-79}$ — windowed Weil positivity for $\xi_Q$ FAILS at $t \leq 3.114$ , built purely from $r_Q(n)$ lattice counts (exact sieve with the exact ward $r_Q = 1 * \chi_{-20} + \chi_{-4} * \chi_5$ ; log-derivative recursion, no Euler product exists; zero cache unused, witness constants firewalled). Controls: TRUE zeta and the conductor-matched null $\zeta_K = \zeta_{L-20}$ complete positivity through $L = 8.0$ (pinned run-of-record; the ZK anchor and $L = 4.0$ prefix recomputed) — conductor alone does not collapse; $Q$ dies at $t_{\text{death}} = 2.988$ (recomputed eigenvalue crossing $k^\dagger = 998$ ; mesh mate stable), and the certificate vector reads POSITIVE on the matched null. The three pre-declared falsified predictions are carried, not smoothed: attribution COLLECTIVE (witness removal moves the death by only 0.018; all-located removal survives to 4.428), the death law misses by $0.505 > 0.5$ , and the census is falsified (FOUR off-line pairs below 45; the witness never $\gamma$ -minimal; the 15.6682 driver carries $26\times$ its excess). Typing: the value is CERT-NUM (source-side, unconditional-numeric); the step “ $V < 0 \Rightarrow$ off-line zero” is COND-CLASSICAL (Weil/Guinand explicit formula, cited); the zeros themselves are Potter–Titchmarsh 1935 — KNOWN falsehood, NEW instrument. NOT evidence for or against RH in either direction: the min-cut is unchanged, a detector is a falsifier, and for zeta any finite window proves nothing. NO RH claim.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| v917_driver_rate_certification.py | PRIME.KR4.DRIVER.CERT.01 [C]: the certified localized rate detection of the driver (13/13). The round-123 driver zero $\rho = 0.9329696975 + 15.6682495313 i$ of $\xi_Q$ , source-located from the $\Lambda_Q$ sieve ( $\Delta\gamma = 6.6 \times 10^{-5}$ ), fires in the band-peeled rate channel at depth $m^* = 14$ with certified LB = 1.000137 $> 1$ , LOCALIZED from $m_{\text{loc}}^* = 15$ . Grade, carried verbatim and never upgraded: CERT-GIVEN-AUDIT (rigorous Cauchy enclosure given the incomplete-gamma audit comparator plus the DECLARED tail/peel models) and DISGUISE-ADJACENT (the deep read is an Euler-computable truncated windowed Weil transform; the Krein carrier cannot exist on $Q$ past the round-123 collapse). Recomputed in-run: the exact matched-pin algebra, sympy-symbolic and dps-200 ( $v^* = 1 + \varepsilon$ EXACTLY REAL at $a^* = \delta^2 + \gamma^2 = 245.681506$ , weight exactly 1, $y^* = (\gamma + i\delta)/(2\gamma)$ , the $a^2/z$ weight-sum rigidity); the violation window $(232.4783, 259.6345) \ni a^*, 256$ ; $m_2 = \ln 2\gamma^2/\delta^2 = 907.7$ ; the exact Pascal-diagonal dictionary (the peel arithmetic, exact in rationals); the band geometry ( $v_{\text{edge}} = 0.639$ , $v_{\text{max,unk}} = 0.386$ ); the full LB/localization/convergence arithmetic from the pinned depth table (margins $1.37/4.02/5.54 \times 10^{-4}$ , $\text{LB} \rightarrow v^*$ to six digits by $m = 25$ , certified depth 32, $\text{Err} \approx 2.1 \times 10^{-12}$ , $\text{meas} \leq \text{cond}$ ); and the quantified detection-cost law $m^* \approx \ln(B_{\text{band}}/\varepsilon)/\ln(1/v_{\text{edge}})$ with sieve price polynomial in $1/\varepsilon$ via the band (measured 3.19 depths per unit $\ln N$ ; the peel collapsed $m_2 = 908$ by $\times 65$ and needed only $N = 2 \times 10^5$ ). Pinned from run-of-record: the 33-row depth table, the winding-complete band census (phantom peel doubly excluded), the locator table and the controls (zeta/ $\zeta_K$ certified-silent, plant fires at $m^* = 15$ ). The honest caveat carried: the pre-declared G11 gate FAILED — the weak round-117 witness (excess $2.9 \times 10^{-5}$ ) sits below the locator’s measured threshold at $N = 2 \times 10^5$ ; the locator is a 3/4 MEASURED instrument and no 4/4 claim is promoted. NOT evidence for or against RH in either direction: the min-cut is unchanged, a certified detector is a falsifier, and the zeros are Potter–Titchmarsh 1935 — KNOWN-FALSEHOOD, NEW-INSTRUMENT. NO RH claim. |

| v918_doublelimit_reduction_theorem.py | PRIME.DOUBLELIMIT.REDUCTION.THEOREM.01 [E]: THEOREM R, the load-bearing reduction of the rounds-128–151 proof arc, promoted as a certified finite theorem (13/13). Statement, proven with elementary inputs: L1 (trace convergence to the source-side target, absolutely convergent exactly for $a > 1/4$ ) + WPD ( $d_1 > 0$ , $ d_k  \leq C 4^{1-k} d_1$ ) $\Rightarrow$ (H-conv) on the full Euler interval + (H-trace) with the explicit rate $\max(1, C) (-4 \log(1 - t/4)) d_1$ , via the exact series identity $\log(R_{\text{fin}}/R_a)(t) = \sum_k t^k d_k/k$ ; with the cited round-122 NF-closure theorem: RH $\Leftarrow$ [NF-closure] + [Theorem R] + {L1, WPD} on dense $a$ . Lemmas N (necessity; Vitali + Cauchy cited), S (subset defect $\Rightarrow$ PD exactly, sharp at the band edge; sandwich pinned $0.121737 \leq 0.124501 \leq 0.289309$ ), X (moment transfer NOT free: $d_1 = 0$ , $d_2 = -1/128$ exactly), and the exact $C_{0k} \leftrightarrow$ jet dictionary. Recomputed in-run: the full exact algebra incl. the adversarial $C \gg 1$ instance and the WPD tail witness $k^*(B) = \lceil \log(2B)/\log(4w^*) \rceil = 29959/76013/145094$ from $4w^* = 10001/10000$ exact (WPD's $k$ -tail IS window positivity). Pinned: the measured ladders ( $d_1$ , WPD constants worst 0.0202 vs bar 1.20, reduction band, RvM node law); source probe re-run green at promotion (28/28, 398.5 s); independently re-derived in Bughunt III. Honest typing carried: L1 OBSTRUCTED, WPD OBSTRUCTED-RH-EQUIVALENT-AT-TAIL; proven is the REDUCTION and the COORDINATE, not the convergence. NOT evidence for or against RH. NO RH claim.                                                                                                                                                                              |
| v919_secular_gw_pinning.py            | PRIME.SECULAR.GW.PINNING.01 [E]: the secular identity + the Guinand-Weil pinning, the two central certified objects of round 131, both independently reproduced in Bughunt IV (11/11). Layer 1, SECULAR-EXACT, recomputed in-run on an own exact-rational instance (Fractions, $K = 6$ , dim 11, 13 interpolation points $>$ degree, sympy-free): $\det(M_\eta - z) = -z C(z^2)/A_0$ EXACTLY – the operator nodes ARE the census-polynomial zeros, node count EXACTLY $K - 1$ , lattice zeros at $j\pi/A$ ; the round-123 $\eta$ -degeneration IS the boundary decay $A_0 \rightarrow 0$ . Layer 2, GW-PINNING, certified per rung and pinned: $\tau = 2 \sum_\rho  E_N(\gamma_\rho) ^2$ within certified envelope + off-line allowance (Guinand-Weil cited; $x = 13$ : $\tau = 2.499 \times 10^{-54}$ vs $P = 2.402 \times 10^{-54}$ , the zeros carry 96%); the smallness law $2 E_N(\gamma_j) ^2 \leq \tau + \text{OFF}$ at every polished band zero; the certified gap law in the resolvability zone $\gamma \leq 2\pi x$ ( $x = 13$ : 21/21 zone zeros pinned, max gap $2.9 \times 10^{-17} \leq 5.6 \times 10^{-8}$ , $\gamma_1$ at $1.9 \times 10^{-50}$ ; edge layer MEASURED-ONLY); L1-TAIL closed in closed form (HSW22 Cor. 1.2 + PT21; recomputed against an own IBP integral, tangent bound the only slack); the crossover theorem ( $A/\pi ==$ RvM density exactly at $T = 2\pi x$ ; INBAND_F = $1/\text{KFAC} = 0.8$ is a THEOREM); the boundary-jet law. Bughunt-IV independent reproduction pinned ( $\tau$ from the classical explicit formula at $x = 3$ , $ \Delta \log_{10}  = 2.7 \times 10^{-7}$ ). Z1 typing carried: input circularity NO, evidence novelty LIMITED; the BAND half of L1 stays OPEN (H-pin). Source probe re-run green at promotion (31/31, 217.4 s). NOT evidence for or against RH. NO RH claim. |

|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| v922_spacing_<br>jet_sumrule_<br>theorems.py    | <p>PRIME.SPACING.JETSUMRULES.THEOREMS.01 [E]: the HPIN/spacing theorem family of rounds 135 and 154 (13/13). All recomputed exactly in-run: D1 – the derivative identity <math>E'_N(\mu_j) == 4 \sin(A\mu_j) F'(\mu_j^2)</math> at every census node (the H-pin floor is <math>F'</math>-currency), with the SPACING-PRODUCT form <math>F'(y_j) == A_0 \prod_{i \neq j} (y_j - y_i) / \prod_k (y_j - b_k)</math>: the floor is a zero-spacing product. D2 – the jet sum rules <math>\sum 1/F' == -A_2/A_0^2</math> and <math>\sum y/F' == -A_4/A_0^2 + A_2^2/A_0^3</math> (the r131 boundary-jet telescope IS the reciprocal-floor moment data); D2'/P5 – the second-order rungs <math>\sum F''/F'^3 == 2A_2/A_0^3</math> and <math>\sum [1/F'^2 - yF''/F'^3] == 3A_2^2/A_0^4 - 2A_4/A_0^3</math> (residue calculus, r154). D3 – the <math>A_0</math>-cancellation: <math>g = c/(2 \sin PR)</math> EXACT (the demand ratio is <math>A_0</math>-free; the floor alone rides <math>\sqrt{\tau}</math>, typed FLOOR-RIDES-CONNES). D4 – the far-lattice tail <math>-\log(1 - q) \leq q/(1 - q^*)</math> certified (Euler sine product cited). The sign-uniform corollary is carried as an OBSTRUCTION (hypothesis measured FALSE: census MIXED; zone sum-rule share collapses <math>1.5 \times 10^{-4} \rightarrow 3.9 \times 10^{-13}</math>).</p> <p>LEAN-HARDENED (round 158): SpacingProduct.lean proves the spacing product for generic finite <math>K</math> over an arbitrary field; JetSumRules.lean all four sum rules at <math>K = 2</math> with the general-<math>K</math> skeleton honesty-locked; names re-checked in-run. Pinned: floor transfer <math>1/1 \dots 53/53</math> zone zeros at gap <math>\leq</math> ball; margins <math>5.8 \rightarrow 5.1 \times 10^{12}</math> growing. Provenance: hpin_floor r135 PINNED (three logs; re-gated r154 + Lean), nearalign r154 RE-RUN GREEN at promotion. H-pin itself stays OPEN; census cardinality 4 unchanged. NOT evidence for or against RH. NO RH claim.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| v923_spectral_<br>balance_razor_<br>theorems.py | <p>PRIME.SPECTRAL.BALANCE.RAZOR.01 [E]: the pinch/enclosure/razor theorem family of rounds 157 and 161 – the complete exact spectral-balance algebra on the QSUBGAP <math>g</math>-floor (20/20). Round-157 theorems, recomputed exactly: SB1 the trace loop <math>\tau \text{ TrH} == \text{tf}/\text{FULLGAP}</math> EXACT with <math>1 \leq \text{tf} \leq K - 1</math> UNCONDITIONAL (tail closed by the count bound alone: DELTA1FLOOR <math>\Leftrightarrow</math> TRACEFLOOR two-sided – the r146 Y1 loop); SB2 the chi-cap <math>s\rho^2\delta_1 \leq 1 - \rho^2</math> (the third rate-blind moment instrument, measured vacuous <math>7.6 \rightarrow 88.8</math> dex); SB3 the enclosure <math>\rho^2\delta_1 \leq g \leq \delta_1</math> both ends exact (one-moment merge REFUTED-MEASURED); SB4 the OVG identity (the r150 OVG-flatness IS the zone-top-gap pinch); SB5 the share floor (true but vacuous: the WEIGHT-LADDER RACE). Round-161 theorems, recomputed exactly: GF1 THE RAZOR ENCLOSURE <math>1/(s + 1/\delta_1) \leq g &lt; 1/s</math> (dominates the r157 lower end via the chi-cap; TWO-LEVEL EQUALITY at the lower end – the exact witness <math>\rho^2 = 1/(1 + P\delta_1)</math> realizes <math>s == P = 10^6</math> AND <math>g ==</math> the lower end EXACTLY: no algebra-only improvement exists; explicit two-way transfer: THE <math>g</math>-FLOOR IS THE <math>s</math>-CAP GIVEN THE <math>\delta_1</math>-FLOOR; measured width <math>1.51 \times 10^{-4} \rightarrow 8.45 \times 10^{-8}</math>); GF2 the pinch law <math>1 - sg == g^2T_2/\rho^2</math> EXACT, defect priced <math>g/\delta_1</math>; GF3 share<math>_1^g \geq</math> share<math>_1</math> one-sided, priced; GF4 the Newton value law <math>N_1 == 1/(H_t + s) + B(q_0) == -\rho^2P'_c(q_0)</math> (the bordered value CARRIES <math>\rho^2</math>) + the jet-ratio chase <math>J_g t_g == 1 + g</math> (the zero-jet mechanism's third rung); GF5 the S1 absorption (ONE decay law) + the twin squeeze at the jet weighting: both final cores are ONE statement-form at two weightings (FORM-merge exact; value-merge refuted – the J-family is BLIND to <math>g</math>). Lean-hardened round 158 (PinchIdentity, SpectralBalance; names re-checked). Pinned: razor lo/<math>g</math> <math>0.999995335 \rightarrow 0.999999995</math>; TRACEFLOOR <math>4.5 \times 10^{-6} \rightarrow 6.1 \times 10^{-9}</math>; SEC <math>4.06 \rightarrow 30.46</math> with betapos <math>== 1/\text{SEC}</math>. Provenance: r157 RE-RUN GREEN at promotion (non-timing diff empty); r161 PINNED per the multi-hour convention (both logs; GF algebra recomputed here). W1–W3 cited from v920. Reoordination only: no omega closed, census cardinality 4 unchanged. NOT evidence for or against RH. NO RH claim.</p> |

| v924_moment_laurent_rootladder.py | <p>PRIME.MOMENT.LAURENT.ROOTLADDER.01 [E]: the moment-Laurent/root-ladder theorem family of round 156 (12/12). All recomputed exactly in-run: L1 THE LADDER IS MOMENT DATA – <math>yS == \sum v + T</math> exactly; with <math>\sum v = a_2 = -y_t</math> and <math>z = y/y_t</math>: <math>(y/y_t)F/A_0 == \Phi(z) = z - 1 + \sum_m J_{m+1}z^{-m}</math> with EXACT partial-geometric remainder (the census roots above the band are the zeros of the moment-Laurent function: self-similarity iff moment flatness); L2 THE QUARTER-CAP – <math>z(1-z) \leq 1/4</math> and <math>\Phi(z_0) = 0 \Rightarrow J_2 == z_0(1-z_0) - z_0\rho(z_0) \Rightarrow J_2 \leq 1/4 + z_0 \rho </math> (the census-real top root caps its OWN leading moment ratio; measured <math>z \rho  \leq 0.0102</math>: the saturation <math>J_2 \rightarrow 0.1506</math> has PROVEN headroom); L3 the exact sum rules <math>a_2 == -P_1</math>, <math>P_2 == a_2^2 - 2a_4</math>, <math>P_3 == 3a_2a_4 - 3a_6 - a_2^3</math> (the ladder power sums ARE the jets); L4 the sign-pattern law (<math>n_{\text{esc}} \leq \text{nsc} + 1</math> exact; Laguerre form cited; <math>V == n_{\text{esc}}</math> at 5/6 blocks, b28 slack disclosed); L5 THE CASCADE (<math>yF_j == a_{2(j+1)} + F_{j+1}</math> exact <math>\Rightarrow T &gt; 0</math> pointwise SOURCE-PURE on <math>[Y^*, \infty)</math>, <math>Y^* = 1.02\text{--}2.1 b_{\text{top}}</math>, zero cache violations – the escaped-root cap CERTIFIED, not measured); L6 the two-sided split (the far window is controlled by <math>J_2</math> ALONE). The wall in final form: the <math>e_0</math>-witness deflates <math>J'_m == J_m P^{(1-m)/2}</math> while <math>T'/y'_t == T/y_t</math> EXACT (shape sector scale-blind); the 2-mode witness inflates <math>J_2 \times 10^6</math> with ALL identities intact – J-BOUNDEDNESS IS ARITHMETIC-PINNED. Lean-hardened round 158 (MomentLaurent.lean, 8 theorems incl. T_laurent with explicit exact remainder; names re-checked). Pinned: <math>J_2 = 0.1117 \rightarrow 0.1506</math> tau-flat; ladder top <math>0.8763 \rightarrow 0.8311</math> with second <math>0.0818\text{--}0.0825</math> CONSTANT over 3 dex; cascade <math>Y^*/b_{\text{top}}</math> with residual sliver <math>1/0/1/0/18/51</math> (closed per-zero in v925). Provenance: r156 RE-RUN GREEN at promotion (zero amendments). T-WINDOW rewritten as {arithmetic <math>J_2</math>-window} + {band-edge sliver + separation}; no omega closed, census cardinality 4 unchanged. NOT evidence for or against RH. NO RH claim.</p> |
